EXECUTIVE SUMMARY

The Remedial Investigation Report (RIR) provides sufficient information for establishment of remedial action objectives, evaluation of remedial action alternatives, and selection of a remedy pursuant to RCNY§ 43-1407(f). The remedial investigation (RI) described in this document is consistent with applicable guidance.

Site Location and Current Usage

The Site is located at 525 West 52nd Street in the Clinton/Hell's Kitchen district of Manhattan, New York and is identified as Block 1081 and Lot 7501 and a portion of Lot 1 on the New York City Tax Map. Figure 1 shows the Site location. The Site is ±36,560-square feet and is occupied on Lot 7501 by a three- to seven-story commercial/office building with a single basement and a loading dock area on the eastern side. The building is four-stories on the northern portion, seven-stories on the southern portion, and three-stories on the eastern portion. The portion of Lot 1 is immediately adjacent to the west of Lot 7501 and is part of the redevelopment site that is currently an at grade parking area operated by U-Haul.

The Site is bound to the north by West 53rd Street followed by a 30-story mixed use residential and commercial building located at 758 11th Avenue and a multi-story AT&T building located at 501-517 West 53rd Street, to the east by a 25-story mixed use residential and commercial building located at 500 West 53rd Street, to the south by West 52nd Street followed by an 8-story residential building located at 535 West 51st Street, and to the west by a one-story commercial building that is operated as a automobile body shop. This lot will also be developed by the Clinton Housing Development Corporation (CHDC) during the construction of the proposed redevelopment of this Site. The layout of the Site is shown on Figure 2.

Summary of Proposed Redevelopment Plan

The proposed development includes a high-rise residential building with a single-cellar level occupying the entire site footprint with exception of a portion on the northeast corner of the building where there is an existing Amtrak easement. The single-cellar level will extend to approximately 16- to 18-feet below the existing sidewalk grade. The proposed use of the cellar is retail, parking, and mechanical / utility rooms. The first floor will consist of retail, bicycle storage, a residential lobby with lounge areas and a courtyard, and mercantile space (to be built out by future tenants). Based on the results of this RI and previous environmental investigations, with the exception of water perched on bedrock which was encountered one- to four-feet below the current basement level of the building on Lot 7501, groundwater is not

likely to be encountered as part of the site redevelopment. Schematic drawings of the proposed redevelopment are provided in Appendix A.

The property is currently zoned as a residential district (R9) with a commercial overlay (C2-5) on Lot 7501 and as a residential district (R8A/R9) with a commercial overlay (C2-5) on the portion of Lot 1 that is part of the Site according the New York City Department of City Planning zoning map dated 26 June 2014. According to the New York City Department of Building the subject property is located in the Special Clinton Zoning District.

According to the description provided by New York City Department of City Planning this zoning is intended to preserve and strengthen the residential character of a community bordering Midtown, maintain a broad mix of incomes and ensure that the community is not adversely affected by new development. The proposed renovation is consistent with existing zoning for the property.

Summary of Past Uses of Site and Areas of Concern

Sanborn Fire Insurance Maps identified that between 1892 and 1950 Lot 7501 was occupied by one- to five-story residential and commercial buildings. In 1951 the current building is shown. A basement labeled as loading flats, two elevators and a gasoline tank are shown. Printing operations are identified on the first floor and offices on the second floor. There are no changes shown until 1987 when the building is identified as United Envelope Company, Inc. and is labeled for manufacturing. There are no changes shown between 1987 and 2005.

Sanborn Fire Insurance Maps for the portion of Lot 1 included in the redevelopment (530-536 West 53rd Street) revealed that the site was occupied by five-story residential buildings between 1892 and 1907. In 1951 the site was vacant except for a small one-story office building in the northwestern corner. In 1979 the site was identified as a parking lot. No changes are shown between 1979 and 2005.

Historic generator information for the site includes forms received by the USEPA classifying the site as a large quantity generator (LQG), small quantity generator (SQG), and as a conditionally-exempt small quantity generator (CESQG) for the disposal of non-listed ignitable waste between 1999 and 2008 under the name Tana Seybert. Written informal violations were issued to the facility on 28 June 2004 during a compliance evaluation inspection and compliance was achieved on 8 August 2004. The subject property is identified in the RCRA NonGen database for forms received by the USEPA classifying the site as a non-generator in 2007 under the name Astrid Offset Corp. Historic generator information includes forms received on 1 January 2007 and 1 January 2006 classifying the site as a non-generator and on 16 January 1996 classifying the site as a small quantity generator. No violations are reported for the facility.

The subject property is also identified in the NY AST and NY HIST AST databases for a 7,000-gallon aboveground storage tank (AST) containing fuel oil that is listed as being in service. The AST was observed during Langan's Phase I site reconnaissance and minor staining was noted on the tank and concrete floor of the vault. The Areas of Concern and Recognized Environmental Conditions (AOCs/RECs) identified for this site include:

Historic Use of the Subject Property: The subject property is identified on USEPA RCRA databases as a generator of non-listed ignitable hazardous waste based on forms received by the USEPA in 1996, 1999, 2001, 2002, and 2004 through 2008. The site has been documented for the disposal of non-listed ignitable hazardous waste in 2009 and the disposal of non-listed ignitable hazardous waste, non-listed corrosive hazardous waste, and silver-impacted hazardous waste between 1996 and 2000. Additionally, historic operations at the subject property as identified by the City Directory include lithography, printing, and a photography laboratory from 1920 through 1998. The Sanborn Fire Insurance Maps show printer operations at the subject property from 1951 through 1985 followed by envelope manufacturing from 1987 through 2005. Sampling was conducted as part of this investigation to assess the potential that hazardous materials associated with the printing, lithographic, and other previous manufacturing operations have impacted subsurface soil and groundwater conditions at the site.

Underground Gasoline Storage Tanks: A gasoline UST is identified on Sanborn Fire Insurance Maps at the southern end of the building from 1951 through 2005. A magnetic anomaly was identified at the southern end of the building during a subsurface investigation completed at the subject property in 2010. Analytical results of the subsurface investigation subsequently completed in the area of the UST revealed no volatile organic compounds (VOCs) above applicable criteria in soil or groundwater in the vicinity of the UST. Based on these findings a release from the UST has not been identified; however, removal of any USTs or associated piping will be required in conjunction with any future site redevelopment.

On-site Historic Fill: Laboratory analytical results of the shallow subsurface fill material collected during previous environmental investigations at the site identified impacts from poly-aromatic hydrocarbons (PAHs) and metals. The presence of impacted fill, which is anticipated to be encountered between the existing basement slab and underlying bedrock, will require implementation of soil handling and management procedures during site redevelopment to address excavation, re-use, handling, and possible offsite disposal of this material.

Summary Previous Investigation Activities

1. A Phase II Subsurface Investigation was completed by General Consolidated Industries, Inc. on 23 May 2006 which included a series of dye tests to identify discharge points for slop sinks, bathrooms, sump pits, floor and trench drains, and printer drainage, and completion of a geophysical investigation to identify possible underground storage tanks (USTs) at the site; no borings or wells were installed as part of this investigation. The results of the dye testing confirmed that five slop sinks, the bathrooms, three printer drainage points, and three of the sump pits are connected to the New York City sewer system and that no further work was required to confirm they were connected to the sewer system. The connection of six of the drainage points could not be confirmed due to the structures being clogged. Two floor drains were reported to be connected to a buried leaching "drywell", although the location of the drywell was not identified. GCI recommended that the clogged structures be pumped out, cleared of debris, and power jetted to clear the structures and the piping. The results of GCI's geophysical investigation and site inspection did not identify any magnetic anomalies that would be indicative of an underground storage tank (UST) or evidence of storage tanks (i.e., patched areas, fill ports, vent lines, manways).

2. A Limited Due Diligence Investigation was completed on 18 November 2010 by Fleming, Lee, Shue, Inc. (FLS) that consisted of:

    a. An additional geophysical survey to determine the presence of USTs as noted on the Sanborn Maps;

    b. Completion of nine soil borings and collection of nine soil samples in the area of the suspected USTs, the floor drains, the boiler room, and an area of stained soil observed in the basement

    c. Completion and sampling of two temporary groundwater monitoring wells in two of the soil boring locations.

    FLS concluded that:

    a. No impacts pertaining to the abandoned UST system were detected in soil or groundwater samples.

    b. No impacts related to discharges to the floor drains were detected in soil or groundwater; the metal concentrations in soils from this area appear to be related to the presence of historic fill on the site.

c. No impacts associated with the floor staining in the southeast corner of the sub-cellar were detected. The semi-volatile organic compounds (SVOCs) detected at this location are likely attributable to the historic fill throughout the site.

d. Slightly elevated concentrations of SVOCs found in the groundwater sample collected from the boiler are most likely related to the presence of the nearby aboveground fuel oil tank.

Analytical results of the 2010 FLS Limited Due Diligence Investigation are discussed below in the Summary of Environmental Findings.

Summary of the Work Performed under the Remedial Investigations

1. Langan completed a Phase II Site Investigation Work Plan on behalf of 525 West 52nd Street Development, LLC on 6 September 2013. Additionally, Langan completed a Phase II Site Investigation Work Plan on behalf of the Clinton Housing Development Company in September 2014. A portion of the investigation that was completed as part of this later work plan was completed on the Site. The following scope of work was completed during the Remedial Investigations:

    a. Conducted a Site inspection to identify AOCs and physical obstructions (i.e., structures, buildings, etc.):

    b. Installed ten soil borings across the entire project Site, and collected 13 soil samples for chemical analysis from the soil borings to evaluate soil quality;

    c. Installed and sampled two temporary groundwater monitoring wells at two of the proposed monitoring well locations. The temporary wells were used to allow for collection of two groundwater samples for chemical analysis to evaluate groundwater quality; and

    d. Installed and sampled seven sub-slab and or shallow sub-surface soil vapor probes throughout the Site.

Summary of Environmental Findings

1. Elevation of the property ranges from 29- to 31-feet above mean sea level (amsl).

2. Groundwater was only encountered in a limited number of borings within the footprint of the existing building; however, where encountered depth to water was approximately 1-foot below the basement slab of the building at Lot 7501. Groundwater was not

encountered in any of the borings completed in the adjacent portion of Lot 1 that is included in this site.

3. Regional groundwater flow is expected to be to the west toward the Hudson River.

4. Depth to weathered bedrock is approximately 1- to 3.5-feet below the basement slab at Lot 7501 and approximately 9-feet below ground surface at the portion of Lot 1 that is included as part of this Site.

5. The stratigraphy of the site beneath the basement slab at Lot 7501 consists of a 1- to 3.5-foot thick layer of historic fill underlain by weathered bedrock. The stratigraphy of the site beneath ground surface at the portion of Lot 1 that is included as part of this Site consists of approximately 8-feet of historic fill underlain by weathered bedrock.

6. Soil/fill samples collected during the 2010 FLS Limited Due Diligence Investigation and 2014 Langan Remedial Investigations were compared to New York State Department of Environmental Conservation (NYSDEC) Part 375 Table 375-6.8 Unrestricted Use and Restricted Residential Use Soil Cleanup Objectives (SCOs). Soil/fill samples collected during the 2010 FLS Limited Due Diligence Investigation showed no volatile organic compounds (VOCs) at concentrations greater than their respective Unrestricted Use SCOs. The metals chromium (33.9 mg/kg), lead (maximum [max] 473 mg/kg), and mercury (max 0.42 mg/kg) were detected at concentrations above their respective Unrestricted Use SCOs from 2- to 3.5-feet below the basement slab (lead also exceeded its Restricted Residential Use SCO in one sample). Exceedances of the NYSDEC Unrestricted Use SCOs were also detected from 2- to 3-feet below the basement slab for semi-volatile organic compounds (SVOCs) including benzo(k)fluoranthene (0.814 mg/kg), chrysene (1.62 mg/kg), benzo(a)anthracene (1.57 mg/kg), benzo(b)fluoranthene (max 1.66 mg/kg), dibenzo(a,h)anthracene (1.62 mg/kg), indeno(1,2,3-cd)pyrene (0.79 mg/kg), and benzo(a)pyrene (max 1.33 mg/kg). Of these, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene, and indeno(1,2,3-cd)pyrene were also detected at concentrations above their respective Restricted Residential Use SCOs.

   Exceedances of SCOs were detected in all samples collected during the 2014 Remedial Investigation (RI) within the historic fill material from 0- to 3-feet below the basement slab at Lot 7501 with the exception of LSB-3. The volatile organic compound (VOC) acetone (0.057 mg/kg) was detected at a concentration above its Unrestricted Use SCO in one soil sample. SVOCs including acenaphthene (max 44.7 mg/kg), benzo(a)anthracene (max 87.3 mg/kg),, benzo(a)pyrene (max 83.9 mg/kg), benzo(b)fluoranthene (max 62.5 mg/kg), benzo(k)fluoranthene (max 70.4 mg/kg),

chrysene (max 84.8 mg/kg), dibenzo(a,h)anthracene (max 9.9 mg/kg), dibenzofuran (max 27.1 mg/kg), fluoranthene (max 223 mg/kg), indeno(1,2,3-cd)pyrene (max 18.9 mg/kg), naphthalene (max 45.6 mg/kg), phenanthrene (max 245 mg/kg), and pyrene (max 205 mg/kg) exceeded their respective Restricted Residential Use SCOs in several samples. With the exception of acenaphthene and naphthalene, all of these SVOCs also exceeded their respective Restricted Residential Use SCOs. All of these maximum values were detected in the shallow sample collected at LSB-2. Pesticides including 4,4'-DDE (max 0.0213 mg/Kg) and 4,4'-DDT (max 0.0081 mg/Kg) exceeded Unrestricted Use SCOs in one sample. The PCB aroclor 1260 (max 2.54 mg/kg) was detected above its Unrestricted Use SCO in three samples and above its Restricted Residential Use SCO in two samples. Metals including barium (max 8,630 mg/kg), copper (max 65.4 mg/kg), lead (max 4,830 mg/kg), mercury (max 0.292 mg/kg), nickel (41.5 mg/kg) and the total chromium (max 61.2 mg/kg) exceeded Unrestricted Residential SCOs in several samples. Of these, barium, lead, and chromium also exceeded their respective Restricted Residential Use SCOs.

7. Groundwater samples collected during the 2010 FLS Limited Due Diligence Investigation and 2014 Langan RI were compared to the NYSDEC Part 703 Groundwater Quality Standards (GQS) for Class GA (drinking water). Analytical results from the 2010 FLS Limited Due Diligence Investigation did not reveal the presence of VOCs above the NYSDEC GQS in either sample collected from the temporary well points. Several exceedances of the GQS for SVOCs were identified in the groundwater sample collected from the boiler room area including benzo(a)anthracene (5.1 micrograms per liter [µg/L]), benzo(b)fluoranthene (4.6 µg/L), benzo(k)fluoranthene (3.5 µg/L), chrysene (5.7 µg/L), indeno(1,2,3-cd)pyrene (3.9 µg/L), and naphthalene (95 µg/L). Low level exceedances were also identified in the groundwater sample collected from the stained soil area including benzo(a)anthracene (max 0.76 µg/L), benzo(b)fluoranthene (0.8 µg/L), chrysene (0.89 µg/L), and indeno(1,2,3-cd)pyrene (0.41 µg/L). Analytical results from the 2013 RI revealed no exceedances of the NYSDEC GQS for VOCs, pesticides, or PCBs in any of the groundwater samples collected. The only SVOC identified above the NYSDEC Part 703 GQS is naphthalene (19 µg/L). Several metals were detected above their respective GQS in the filtered samples including magnesium, selenium, and sodium.

8. The soil vapor results collected during the RI were compared to the compounds listed in Table 3.1 Air Guideline Values Derived by the NYSDOH located in the New York State Department of Health (NYSDOH) Final Guidance for Evaluating Soil Vapor Intrusion. Several petroleum-related and chlorinated VOCs were identified at low levels in soil vapor samples. Maximum concentration of petroleum-related compounds (BTEX) was at 331 microgram per cubic meter [µg/m^3]. Overall, the highest concentrations were

detected for acetone (max 380 ug/m^3) and trichlorofluoromethane (Freon 11) (max 440 ug/m^3). Chlorinated VOCs were detected at low levels. Trichloroethylene (TCE) was detected in one sample at 0.34 µg/m^3, 1,1,1-trichloroethane (1,1,1-TCA) was detected in one sample at 0.98µg/m^3, carbon tetrachloride was detected in one sample at 0.90 µg/m^3, and tetrachloroethylene (PCE) was detected in several samples at a maximum concentration of 28 µg/m^3. According to the Soil Vapor/Indoor Air Matrices 1 and 2 provided in the NYSDOH guidance, these chlorinated solvent results indicate that no further action is required.

REMEDIAL INVESTIGATION REPORT

1.0 SITE BACKGROUND

525 West 52nd Street LLC and the Clinton Housing Development Company has completed this investigation to fulfill the requirements of the hazardous materials E-Designation that has been placed on the 0.84-acre site located at 525 West 52nd Street located in Manhattan, New York. Mixed commercial/residential use is proposed for the property. The RI work completed by Langan was performed between 7 and 9 January 2014 and between 9 and 11 October 2014. Previous Phase II investigations were completed on 23 May 2006 and 18 November 2010 as discussed in Section 2.2. This Remedial Investigation Report (RIR) summarizes the nature and extent of contamination and provides sufficient information for establishment of remedial action objectives, evaluation of remedial action alternatives, and selection of a remedy that is protective of human health and the environment consistent with the use of the property pursuant to RCNY§ 43-1407(f).

1.1 Site Location and Current Usage

The Site is located at 525 West 52nd Street in the Clinton/Hell's Kitchen district of Manhattan, New York and is identified as Block 1081, Lot 7501 and a portion of Lot 1 on the New York City Tax Map. Figure 1 shows the Site location. The Site is ±36,560-square feet and is occupied by a commercial/office building with a single basement and a loading dock area on the eastern side on Lot 7501. The building is four-stories on the northern portion, seven-stories on the southern portion, and three-stories on the eastern portion. The portion of Lot 1 is immediately adjacent to the west of Lot 7501 and is part of the redevelopment site which is currently occupied by an at-grade parking area operated by U-Haul.

The Site is bound to the north by West 53rd Street followed by a 30-story mixed use residential and commercial building located at 758 11th Avenue and a multi-story AT&T building located at 501-517 West 53rd Street, to the east by a 25-story mixed use residential and commercial building located at 500 West 53rd Street, to the south by West 52nd Street followed by an 8-story residential building located at 535 West 51st Street, and to the west a one-story commercial building that is operated as a automobile body shop. This lot will also be developed by the Clinton Housing Development Corporation (CHDC)

during the construction of the proposed redevelopment of this Site. The layout of the Site is shown on Figure 2.

1.2 Proposed Redevelopment Plan

The proposed development includes a high-rise residential building with a single-cellar level. The building will occupy the entire site footprint. The proposed use of the cellar is retail, storage, mechanical / utility rooms and tenant amenity space. The first floor will consist of retail, bicycle storage, a residential lobby with lounge areas and a courtyard, and mercantile space (to be built out by future tenants), The single-cellar level will occupy the entire footprint of the Site with the exception with the exception of an approximately 85- by 25-foot area at the northeast side of the Site and will extend to approximately 16- to 18-feet below the existing sidewalk grade which corresponds approximately to immediately below the existing basement slab of the building on Lot 7501. Based on the results of the previous environmental investigation and the current remedial investigation, groundwater if encountered would be limited to water perched above the shallow bedrock, which was encountered one- to four-feet below the current basement level of the building at Lot 7501. Schematic drawings of the proposed redevelopment are provided in Appendix A.

The property is currently zoned as a residential district (R9) with a commercial overlay (C2-5) on Lot 7501 and as a residential district (R8A/R9) with a commercial overlay (C2-5) on the portion of Lot 1 that is part of the Site according the New York City Department of City Planning zoning map dated 26 June 2014. According to the New York City Department of Building the subject property is located in the Special Clinton Zoning District.

According to the description provided by New York City Department of City Planning this zoning is intended to preserve and strengthen the residential character of a community bordering Midtown, maintain a broad mix of incomes and ensure that the community is not adversely affected by new development. The proposed renovation is consistent with existing zoning for the property.

1.3 Description of Surrounding Property

Figure 3 shows the surrounding land usage. Surrounding properties include multi-story residential, industrial, and mixed-use buildings. The subject property is bounded to the north by West 53rd Street followed by a 30- story mixed use

residential and commercial building located at 758 11th Avenue and a multi-story AT&T, Inc. utility building located at 501-517 West 53rd Street, to the east by a 25 story mixed use residential and commercial building located at 500 West 53rd Street, to the south by West 52nd Street followed by an 8-story residential building located at 535 West 51st Street, and to the west by a one-story commercial building that is operated as a automobile body shop. This lot will also be developed by the Clinton Housing Development Corporation (CHDC) during the construction of the proposed redevelopment of this Site. Sensitive receptors include community gardens located approximately 180-feet to the southeast and a community park 360-feet to the west, a daycare center located approximately 360-feet to the north, a school with an associated garden located approximately 525-feet to the east, and a school located approximately 320-feet to the southwest of the Site.

2.0 SITE HISTORY

2.1 Past Uses and Ownership

Sanborn Fire Insurance Maps reviewed for the site as part of a September 2013 Phase I ESA performed by Langan identified that in 1892 the site was occupied by eight buildings ranging from one- to five-stories. The 1907 Sanborn Map shows the site as being occupied by 14 buildings ranging from one- to five-stories identified as mixed residential and commercial use. The 1926 and 1950 Sanborn Maps show nine five-story buildings identified for mixed residential and commercial use along with a vacant lot. The 1951 Sanborn Map identifies the existing three- to seven-story building at the site. A basement labeled as loading flats, two elevators and a gasoline tank are also shown. Printing operations are identified on the first floor and offices on the second floor. The 1976, 1979, 1980, and 1982 Sanborn Maps identify conditions similar to those of the 1950 Sanborn Map. The 1987 Sanborn Map shows the subject property is now identified as United Envelope Company, Inc. and is labeled for manufacturing. The 1990-2005 Sanborn Maps show conditions to be similar to the 1987 Sanborn Map.

Sanborn Fire Insurance Maps were also reviewed for the portion of Lot 1 included in the redevelopment (530-536 West 53rd Street). In 1892 four five-story buildings with backyards occupied the site. In 1907 the buildings were labeled as residential and commercial. In 1951 the site was vacant except for a small one-story office building in the northwestern corner. In 1979 the site was

identified as a parking lot. The 1980-2005 Sanborn Maps show conditions to be similar to the 1979 Sanborn Map.

As part of the information gathered about the past use of the property, Langan reviewed historic United States Environmental Protection Agency (USEPA) information that was provided in the EDR report that was generated as part of the Phase I ESA. Historic generator information obtained during the ESA includes forms received by the USEPA on 26 February 2008, 1 January 2007, 15 February 2006, 25 August 2005, 1 March 2004, 24 February 2002, and 1 January 2001 classifying the site as a large quantity generator (LQG), forms received on 14 February 2006 classifying the site as a small quantity generator (SQG), and forms received on 2 September 1999 classifying the site as a conditionally-exempt small quantity generator. Written informal violations were issued to the facility on 28 June 2004 during a compliance evaluation inspection and compliance was achieved on 8 August 2004. The subject property is identified in the RCRA NonGen database for forms received by the USEPA on 1 January 2007 classifying the site as a non-generator. Historic generator information includes forms received on 1 January 2007 and 1 January 2006 classifying the site as a non-generator and on 16 January 1996 classifying the site as a small quantity generator. No violations are reported for the facility.

The subject property is also identified in the NY AST and NY HIST AST databases for a 7,000-gallon aboveground storage tank containing fuel oil that is listed as being in service. The AST was observed during Langan's Phase I site reconnaissance and minor staining was noted on the tank and concrete floor of the vault.

No ownership records were available from the New York City Department of Finance to determine former site ownership.

2.2 Previous Investigations

The following environmental reports have been completed for the Site. Digital (PDF) copies of the below referenced environmental reports are included in Appendix B:

- Phase I ESA prepared by Environmental Management Solutions of New York, Inc. (EMSNY), dated May 20, 2004

- Phase II Subsurface Investigation prepared by General Consolidated Industries, Inc. (GCI), dated June 2, 2006
- Limited Due Diligence Investigation Report prepared by FLS, dated December 20, 2010
- Phase I ESA prepared by AKRF, Inc., dated July 3, 2012
- Phase I ESA prepared by Langan, dated September 6, 2013

Historic sample locations are shown on Figure 4, historic soil analytical data is summarized in Table 1 and shown on Figure 5, and historic groundwater analytical data is summarized in Table 2 and shown on Figure 6. A summary of these reports is provided below.

Phase I ESA prepared by EMSNY, dated May 20, 2004

The Phase I ESA was prepared on behalf of Newmark Realty. Site activities documented during the Phase I ESA inspection included small scale printing and lithography, paper and printing products storage and some office use. The site walkthrough completed by EMSNY identified containers of photographic chemicals, inks, and containers of alcohol (associated with printing processes), unlabeled three- to five-gallon containers containing unknown liquids, and a 55-gallon drum with a hazardous waste label that was determined to contain waste alcohol generated during printing press cleaning activities. A vaulted 7,500-gallon fuel oil aboveground storage tank (AST) was observed in the basement of the building. Ink stains were observed in areas where printing activities were conducted and oil staining was observed on the basement floor in the boiler area. EMSNY indicated that residual hazardous waste from printing processes may be onsite and cited this as a REC.

Phase II Subsurface Investigation Report prepared by GCI, dated June 2, 2006

The Phase II Subsurface Investigation was completed on behalf of Commerce Bank, N.A. The Phase II report references a Phase I ESA report, dated May 5, 2006 that was completed by GCI. Although a copy of this Phase I report was not provided for Langan's review, the Phase II provided a summary of RECs that were identified in the Phase I. According to this summary, the Phase I identified the potential for accidental spills and/or illegal discharges during photographic developing and printing operations at the site, both at the time of inspection and historically was an REC. Based on GCI's historical records review, a gasoline tank was located at the site from circa 1951 until at least 1996.

The GCI Phase II investigation included a series of dye tests to identify discharge points for slop sinks, bathrooms, sump pits, floor and trench drains, and printer drainage and a geophysical investigation to identify possible USTs at the site. The results of the dye testing confirmed that five slop sinks, the bathrooms, three printer drainage points, and three of the sump pits are connected to the New York City sewer system and that no further work was required to confirm they were connected to the sewer system. Six drainage points could not be confirmed to be connected to the municipal sewer system due to the structures being clogged. Two floor drains were reported to be connected to a buried leaching "drywell", although the location of the drywell was not identified. GCI recommended that the clogged structures be pumped out, cleared of debris, and power jetted to clear the structures and the piping. The results of GCI's geophysical investigation and site inspection did not identify any magnetic anomalies that would be indicative of an UST or other evidence of storage tanks.

Limited Due Diligence Investigation Report prepared by FLS, dated December 20, 2010

The 2010 limited due diligence investigation consisted of the following:

- A site visit to observe evidence of potential contamination associated with historic use of the site;
- A review of historic Sanborn maps for the site and surrounding properties to determine the types and dates of historic activities that may have impacted the Site;
- A geophysical survey to determine the potential presence of a UST shown on the 1951 Sanborn map; and,
- A limited subsurface investigation that included the installation of nine soil borings and two temporary well-points and the collection of soil and groundwater samples for laboratory analysis.

The results of the site reconnaissance and historic map review indicated environmental concerns including: the potential presence of on-site buried petroleum tanks, floor drains of an unknown configuration within the building basement, an active fuel oil AST located within a the basement boiler room (and associated piping of an unknown configuration), and a localized area of oil staining on the concrete slab in the southeastern portion of the basement.

The geophysical survey detected magnetic anomalies indicative of buried USTs in the southern portion of the basement as well as other anomalies in the same area. Soil borings were completed in the vicinity of the potential buried UST,

floor drains, the boiler room, and an area of stained concrete within the basement. The results of soil sampling were compared to New York State Department of Environmental Conservation (NYSDEC) Technical and Administrative Guidance Memorandum (TAGM) Recommended Soil Cleanup Objectives (RSCOs) and revealed the presence of semi-volatile organic compounds (SVOCs), zinc, and mercury at concentrations above their respective RSCOs.

Langan compared the analytical data to the NYSDEC Subpart 375-6 Soil Cleanup Objectives (SCOs) and exceedances for metals and SVOCs were identified. Exceedances of the Unrestricted Use Objectives (UUOs) for lead were identified in FLS-UST-1 (81.3 mg/kg), FLS-UST-4 (80.1 mg/kg), FLS-FD-2 (97.4 mg/kg), and FLS-FD-3 (75.3 mg/kg). Exceedances of the UUOs were identified for mercury in FLS-FD-3 (0.42 mg/kg). Chromium results were compared to the hexavalent chromium SCOs to evaluate the need for separate chromium analyses. Exceedances of the UUOs were identified for chromium in FLS-FD-1 (3.9 mg/kg) and FLS-FD-2 (11.2 mg/kg) and an exceedance of the Residential Restricted Use Soil Cleanup Objectives (RUSCOs) for chromium was identified in FLS-FD-3 (33.9 mg/kg).

Exceedances of the SCOs for SVOCs were identified in FLS-STAINSOIL including exceedances of the UUOs for benzo(k)fluoranthene (0.814 mg/kg), exceedances of the Residential RUSCOs for chrysene (1.62 mg/kg), exceedances of the Restricted Residential RUSCOs for benzo(a)anthracene (1.57 mg/kg) and benzo(b)fluoranthene (1.66 mg/kg), dibenzo(a,h)anthracene (0.371 mg/kg), and indeno(1,2,3-cd)pyrene (0.79 mg/kg), and exceedances of the Restricted Industrial RUSCOs for benzo(a)pyrene (1.33 mg/kg).

Additionally, the reporting limit (RL) for VOC 1,4-dioxane exceeded the UUO of 0.1 mg/kg in all nine samples analyzed.

The low level exceedances of metals and SVOCs were not indicative of releases from the identified tanks or subsurface structures and are attributable to the presence of historic urban fill at the Site.

The results of groundwater sampling did not reveal the presence of VOCs above the NYSDEC Part 703 Groundwater Quality Standards (GQS) in either sample collected from the temporary well points. Several exceedances of the GQS for SVOCs were identified in the groundwater sample collected from the boiler room area including benzo(a)anthracene (5.1 ug/l), benzo(b)fluoranthene (4.6 ug/l), benzo(k)fluoranthene, chrysene (5.7 ug/l), indeno(1,2,3-cd)pyrene, and naphthalene (95 ug/l). Low level exceedances were also identified in the groundwater sample collected from the stained soil area including

benzo(a)anthracene (0.76 ug/l), benzo(b)fluoranthene (0.8 ug/l), chrysene (0.89 ug/l), and indeno(1,2,3-cd)pyrene (0.41 ug/l). FLS concluded that the presence of SVOCs in the boiler room groundwater sample was likely petroleum-related and the presence of SVOCs in the stained soil area sample was likely related to sediment entrainment in the groundwater sample.

Phase I ESA prepared by AKRF, Inc., dated July 3, 2012

The Phase I ESA was completed on behalf of the Clinton Housing Development Company for the addresses at 530-548 West 53rd Street, 543 West 52nd Street, and 525 West 52nd Street. RECs associated with Lot 7501 and the portion of Lot 1 included the following:

- Historical use of the Site for printing operations and manufacturing;
- The Site was listed in the regulatory databases as a generator of hazardous wastes for the production of waste streams, including ignitable wastes, corrosive wastes and silver associated with former printing operations;
- Portions of Lot 1 (530-538 West 53rd Street) were covered with soil likely associated with ongoing excavation at the adjacent construction site;
- The Site at Lot 7501 was listed in the NYSDEC Spills database with two closed regulatory status spills, and;
- A reference to the FLS report and the findings of the limited subsurface investigation detailed above.

The AKRF Phase I also referenced the 7,000-gallon No. 2 fuel oil AST in the basement of the Site, and potential for ACM, LBP, and polychlorinated biphenyls (PCB) in building materials and equipment. Off-site historic RECs identified by AKRF included automotive facilities, gasoline storage tanks, a welding shop, a filling station associated with a migrating contaminant plume, a taxi repair facility, several repair shops and metal works facilities, and manufacturing businesses. AKRF's recommendations following their due diligence included a subsurface investigation with laboratory analysis of soil, soil vapor, and groundwater samples.

Phase I ESA prepared by Langan, dated September 6, 2013

The Phase I ESA was completed on behalf of 525 West 52nd Street Development, LLC for the site at 525 West 52nd Street. RECs associated with 525 West 52nd Street included the following:

- Historical use of the Site for hazardous waste generation and disposal and use for lithography, printing, photography laboratory, and envelope manufacturing purposes; and,
- Potential impacts from surrounding sites including open Spills.

3.0 SITE INSPECTION

Chris McMahon of Langan conducted an inspection of Lot 7501 on 28 June 2013. During the inspection the site was occupied by a commercial/office building with a concrete slab and concrete foundation wall basement and a loading dock area on the northeastern side. The northern portion of the building is four stories, the southern portion is seven-stories, and the eastern portion is three stories.

The basement of the building is accessible from the 53rd Street side via a concrete ramp and from a stairway on the southern side of the building. The southwestern portion of the basement is occupied by the ramp and the southeastern portion was occupied by a steel rack storage system containing construction supplies and small gasoline and electrically powered equipment.

The remaining central and southern portions of the basement were used as a vehicle parking area, and an electrical and mechanical equipment storage. The basement floor is constructed with a concrete slab that was observed to be in fair condition. Disconnected piping within one area of the basement is likely associated with a UST that was previously identified on the southern portion of the parking area of the basement. It is assumed that this UST area is the gasoline UST that is identified in the 1951 Sanborn Map.

The mechanical equipment storage area was observed to contain two fuel oil fired boilers and one natural gas fired boiler. Fuel oil for the boiler is supplied by a 7,500-gallon No. 2 fuel oil AST that is located within a concrete block vault. The mechanical equipment storage area was observed to contain several sump pits that were observed to contain water. No sheens or stains were observed in the sumps.

The building contained one passenger elevator and three freight elevators. The building is heated with a combination of natural gas and a No. 2 fuel oil-fired boiler system.

The ground floor of the building is occupied by a limousine company parking area on the ground floor and the lobby for the former office and printing operations. A vent pipe and suspected fill port were observed within the sidewalk of the 52nd Street

frontage side of the building. This vent pipe and fill port are assumed to be associated with the 7,500-gallon fuel oil AST.

The second floor of the building contained office space that was partially occupied and manufacturing space that was vacant. The remaining upper floors of the building contained vacant manufacturing areas and accessory offices.

A site inspection was completed on 9 October 2014 by a Langan staff engineer prior to the commencement of the October 2014 RI. The portion of Lot 1 that will be developed with Lot 7501 was observed to be vacant.

4.0 AREAS OF CONCERN

The AOCs identified for this site include:

Historic Use of the Subject Property: The portion of the property at Lot 7501 is identified on USEPA RCRA databases as a generator of non-listed ignitable hazardous waste based on forms received by the USEPA in 1996, 1999, 2001, 2002, and 2004 through 2008. The site has been documented for the disposal of non-listed ignitable hazardous waste in 2009 and the disposal of non-listed ignitable hazardous waste, non-listed corrosive hazardous waste, and silver-impacted hazardous waste between 1996 and 2000. Additionally, historic operations at the subject property as identified by the City Directory include lithography, printing, and a photography laboratory from 1920 through 1998. The Sanborn Fire Insurance Maps show printer operations at the subject property from 1951 through 1985 followed by envelope manufacturing from 1987 through 2005. Due to the potential that chemicals associated with the printing, lithographic, and other previous manufacturing operations may have impacted subsurface soil and groundwater conditions at the site, the historic use of the subject property is considered an AOC and was assessed as part of this investigation.

Underground Gasoline Storage Tanks: A gasoline UST is identified on Sanborn Fire Insurance Maps at the southern end of the building on Lot 7501 from 1951 through 2005. A magnetic anomaly was identified at the southern end of the building during a subsurface investigation completed at the subject property in 2010. Analytical results of the subsurface investigation subsequently completed in the area of the UST revealed no volatile organic compounds (VOCs) above applicable criteria in soil or groundwater in the vicinity of the UST. Based on these findings a release from the UST has not been identified; however, removal of any USTs or associated piping will be required in conjunction with any future site redevelopment.

Soil From Adjacent Construction Site: The portion of the property on Lot 1 was historically covered with soil likely associated with excavation activities at an adjacent construction site. While no signs of contamination were noted, no documentation on the actual source and the quality of the soil is available.

On-site Historic Fill: Laboratory analytical results of the shallow subsurface fill material collected during previous environmental investigations at Lot 7501 identified impacts from poly-aromatic hydrocarbons (PAHs) and metals at concentrations typically associated with historic urban fill. Additionally, due to the location of the Site in a heavily urbanized area, it is likely that historic fill is present in the subsurface in the portion of Lot 1 that is part of this Site. The presence of historic fill represents an AOC.

A map showing the location of soil borings and monitoring wells is provided as Figure 4.

6.1 Boring and Monitoring Well Installation

Drilling and Soil Logging

On 7 January 2014, seven soil borings (LSB-1 through LSB-7) were completed at Lot 7501. The borings were completed by PAL Environmental (PAL) of Long Island City, New York, using a track-mounted Geoprobe® 7822DT Direct Push Drilling Rig to a maximum depth of 3-feet below the current basement slab. Perched water was encountered approximately 1- foot below the basement slab. On 9 October 2014, three soil borings (LSB-8 through LSB-10) were completed in the portion of Lot 1 that is part of the Site. The borings were completed by

PAL using a track-mounted Geoprobe® 7822DT Direct Push Drilling Rig to a maximum depth of 9-feet below ground surface. Water was not encountered in any of the borings.

Continuous macrocore samples were collected to the bottom of each boring and soil was classified and visually screened for evidence of contamination. Field screening of soil during sample collection for VOCs using a photo-ionization detector (PID) was completed during the installation of all seven test borings. No PID readings above background were detected.

Boring logs were prepared by a Langan engineer and are attached in Appendix C. Table 2 provides sample location details, including boring, monitoring well, and soil vapor construction information.

Groundwater Monitoring Well Construction

On 7 January 2014, two groundwater monitoring wells (LMW-3 and LMW-4) were installed by a licensed well driller of PAL Environmental (PAL) of Long Island City, New York. Monitoring wells were completed to a depth of 1.75-feet below the basement slab. Monitoring wells LMW-3 (LSB-5) and LMW-4 (LSB-6) were constructed with 1.75-feet of 2-inch diameter Schedule 40 0.020-inch PVC well screen. Following installation, each well was developed by removing a total of five well volumes using a peristaltic pump and dedicated polyethylene tubing or until the groundwater was relatively free of silt.

Monitoring well locations are shown on Figure 4 and a summary of monitoring well construction is provided in Table 2.

Proposed monitoring wells LMW-1 and LMW-2 were not installed as groundwater was not encountered at boring locations LSB-1 and LSB-2. Monitoring wells were not installed on the portion of Lot 1 that is part of the site as groundwater was not encountered in any of the borings installed.

Water Level Measurement

Groundwater levels were recorded on the groundwater sampling field sheets (provided in Appendix C) prior to sampling with a water level meter.

6.2 Sample Collection and Chemical Analysis

Sampling performed as part of the field investigation was conducted for all Areas of Concern and also considered other means for bias of sampling based on professional judgment, area history, discolored soil, stressed vegetation, drainage patterns, field instrument measurements, odor, or other field indicators. All media including soil, groundwater and soil vapor have been sampled and evaluated in the RIR. Discrete (grab) samples have been used for final delineation of the nature and extent of contamination and to determine the impact of contaminants on public health and the environment. The sampling performed and presented in this RIR provides sufficient basis for evaluation of remedial action alternatives, establishment of a qualitative human health exposure assessment, and selection of a final remedy. A summary of samples collected for chemical analyses, including material sampled and sample depths, are summarized in Table 1. A summary of analytical methods is provided in Table 3.

The installation of ten soil borings, two groundwater monitoring wells, five subslab soil vapor points, and two deep soil vapor points and collection of thirteen soil samples, two groundwater samples, five subslab soil vapor samples, and two deep soil vapor samples was completed to assess the potential that the surrounding properties have adversely impacted the site as well as delineate any on-site impacts associated with historic use of the subject property. All samples were submitted to York Analytical Laboratories of Stratford, Connecticut (York), a New York State Department of Health (NYSDOH) Environmental Laboratory Accreditation Program (ELAP) certified laboratory.

Soil Sampling

Thirteen soil samples were collected for chemical analysis during this RI. Data on soil sample collection for chemical analyses, including material sampled and sample depths, is reported in Table 1. Figure 4 shows the location of samples collected in this investigation. The complete laboratory data packages are included as Appendix D. Laboratory and analytical methods are discussed below.

On 7 January 2014, seven soil borings (LSB-1 through LSB-7) were completed at Lot 7501. LSB-1 through LSB-7 were installed at approximately evenly spaced intervals throughout the site to investigate site soil conditions, assess the potential presence of impacts from off-site sources, historic site operations, and historic fill. One sample was collected from each boring.

Samples for laboratory analysis were collected from the entire sample interval due to poor recovery. Soil samples were submitted to York for VOCs, SVOCs, pesticides, PCB, and metal analysis. LSB-3 was analyzed for VOCs only due to poor recovery.

On 9 October 2014, three soil borings (LSB-8 through LSB-10) were completed at Lot 1. LSB-8 through LSB-10 were installed at approximately evenly spaced intervals throughout the site to investigate site soil conditions, assess the potential presence of impacts from off-site sources, historic site operations, and historic fill. Two samples were collected from each boring. One sample was collected from the 0- to 2-foot below ground surface (bgs) interval and one sample was collected from the base of LSB-8 and LSB-9. One sample was collected from 3- to 5-feet bgs at LSB-10 due to the presence of staining.

Soil samples were submitted to York for VOCs, SVOCs, pesticides, PCB, and metal analysis.

Quality Assurance/Quality Control

All sampling devices (macrocores) were properly decontaminated according to NYSDEC and ASTM (ASTM D-5088-90) guidelines prior to each sampling location. This included a thorough soap/water wash to remove solid residues, followed by successive rinses of tap water and distilled/deionized water. Each macrocore was lined with a dedicated acetate liner prior to the collection of each 5-foot long soil sample. Soil samples were then placed in glass jars supplied by the laboratory. Soil samples collected for VOCs were obtained via a plunger calibrated to collect approximately 5 grams of soil and then placed in a VOA vial that was preserved with methanol or distilled water. Each soil sample was recorded in a field log book. Samples were transferred to the laboratory immediately after field sampling was completed, and were stored at a maximum of 4° Celsius. Chain-of-custody forms were utilized to document custody for the acquisition, possession, and analysis.

Quality assurance and quality control samples were incorporated into the sampling events at a frequency in accordance with the New York State Department of Environmental Conservation (NYSDEC) DER-10 Technical Guidance for Site Investigation and Remediation as required by NYCOER and consisted of one field blank and one duplicate sample. The field blank and duplicate samples were analyzed for VOCs, SVOCs, PCBs, pesticides, and metals.

Groundwater Sampling

Two groundwater samples were collected for chemical analysis during this RI. Groundwater sample details, including dates of collection and screen intervals, are reported in Table 2. Table 3 provides a summary of the analytical methods that were performed for each sample. A summary of groundwater laboratory analytical results are provided in Table 5. Sampling logs with field parameters collected during purging and sampling of groundwater monitor wells are included in Appendix C. Figure 4 shows the location of groundwater monitoring wells and Figure 6 shows a summary of the analytical exceedances of Groundwater Quality Standards. Laboratory and analytical methods are discussed below.

In order to assess groundwater conditions on the subject property two groundwater monitoring wells (LMW-3 and LMW-4) were installed in soil borings LSB-5, and LSB-6, respectively.

On 8 January 2014, two groundwater samples were collected for chemical analysis from the wells installed as part of this RI. The wells were sampled via USEPA low-flow sampling methods. Groundwater field parameters, including pH, specific conductivity, dissolved oxygen, oxidation-reduction potential, temperature, and turbidity were measured during low-flow purging activities. Groundwater Field Sampling Logs are provided in Appendix C. Visual observations were made of groundwater samples that were collected using a peristaltic pump and dedicated bailers. No evidence of sheen or free product was observed in any of the monitoring wells.

Grab groundwater samples were collected and submitted to York for analysis for VOCs, SVOCs, pesticides, PCBs, and total and dissolved metals. VOCs samples were collected using a dedicated bailer and the remaining samples were collected using dedicated tubing and a peristaltic pump.

Quality Assurance/Quality Control

Collected groundwater samples were placed in containers supplied by the laboratory with the appropriate preservatives. Each groundwater sample was numbered and recorded in a field log book. Samples were transferred to the laboratory immediately after field sampling was completed, and stored at a maximum of 4° Celsius. Chain-of-custody forms were utilized to document custody for the acquisition, possession, and analysis.

Quality assurance (trip blank) and quality control (field blank and duplicate) samples were incorporated into the sampling events as required by NYCOER and consisted of one field blank, one duplicate sample, and one trip blank. The groundwater field blank and duplicate samples were analyzed for VOCs, SVOCs, PCBs, pesticides and metals. The trip blank was analyzed for VOCs only.

Soil Vapor Sampling

In order to assess soil gas conditions and evaluate any potential vapor intrusion conditions (pVICs) on the subject property, five temporary subslab soil vapor points (LSV-1 through LSV-5) were installed at Lot 7501 and two temporary deep soil vapor points (LSV-4 and LSV-7) were installed in the portion of Lot 1 that is part of the Site as part of the subsurface investigation activities. Each point was sampled as per NYCOER, NYSDOH, and NYSDEC guidelines.

Five subslab soil vapor probes were installed at Lot 7501 and five subslab soil vapor samples were collected for chemical analysis during this RI. In addition, two deep soil vapor probes were installed in the portion of Lot 1 that is occupied by a vacant lot and part of the Site and two soil vapor samples were collected for chemical analysis during this RI. Soil vapor sampling locations are shown in Figure 4. A summary of analytical results compared to the NYSDOH 2006 Soil Vapor Intrusion Guidance Matrices as well as the 2003 Study of Volatile Chemicals in Air of Fuel Oil Heated Homes guidance and the United States Environmental Protection Agency (USEPA) 2001 Building Assessment and Survey Evaluation (BASE) Database using Summa Canister Method is provided on Figure 6 and in Table 6. Soil vapor sampling logs are included in Appendix C. Methodologies used for soil vapor assessment conform to the NYSDOH Final Guidance on Soil Vapor Intrusion, October 2006.

Temporary subslab soil vapor points were installed on 9 January 2014 by Langan using a hammer drill to a depth immediately below the basement slab. A Teflon-lined polyethylene tube was then placed through the penetration and sealed using modeling clay. Deep temporary soil vapor points were installed on 9 and 11 October 2014 by PAL. Teflon-lined polyethylene tubing connected to a 6-inch stainless steel screen was lowered into the boreholes for LSB-8 and LSB-9 to install LSV-6 and LSV-7, respectively, to a few inches above the base of the boring. Glass beads were used to backfill the screened interval followed by No. 2 sand to approximately 0.5-feet above the screened interval followed by hydrated granular Bentonite clay to the ground surface.

Each soil vapor sampling point was tightness tested using the helium tracer gas method and purged at a flow-rate of <200-ml per minute. No evidence of helium breakthrough (i.e., helium concentrations above 5%) was observed in any of the sample locations before sample collection. PID readings for VOCs ranging from 184 ppb (LSV-3) to 744 ppb (LSV-1) were observed during field screening of each location at Lot 7501. No PID readings were detected during field screening at Lot 1.

Quality Assurance/Quality Control

Subslab and deep soil vapor samples were laboratory analyzed for VOCs via USEPA TO-15 Method. Samples were collected in laboratory-cleaned and certified evacuated 6-L stainless steel summa canisters with regulators supplied by York. The regulators were set to collect each sample over a 2-hour sampling period (a flow-rate of <200-ml per minute) as per USEPA/ITRC soil vapor sampling guidance. Each soil vapor sample was numbered and recorded in a field log book. Samples were transferred to the laboratory immediately after field sampling was completed, and stored at a maximum room temperature of 30° Celsius. Chain-of-custody forms were utilized to document custody for the acquisition, possession, and analysis.

Quality assurance samples (ambient blank) and quality control (duplicate) samples were collected and incorporated into the sampling events as required by NYS DOH Final Vapor Intrusion Guidance. The ambient blank and duplicate were analyzed for TO-15.

Results of Chemical Analyses

Laboratory data for soil, groundwater, and soil vapor are summarized in Tables 4, 5, and 6, respectively. Laboratory data deliverables for all samples evaluated in this RIR are provided in Appendix D.

7.0 ENVIRONMENTAL EVALUATION

7.1 Geological and Hydrogeological Conditions

Stratigraphy

Based on on-site test borings completed as part of this RIR and previously completed as part of the 2010 Limited Due Diligence Investigation, subsurface conditions at Lot 7501 generally consist of a 1- to 3.5-foot thick layer of fill material underlain by weathered bedrock beneath the basement slab. Subsurface conditions in the portion of Lot 1 that is part of the Site generally consists of eight-feet of fill material underlain by weathered bedrock.

Hydrogeology

Groundwater levels were collected using an interface probe capable of identifying non-aqueous phase liquids (NAPL) from each well prior to purging and sampling. Light NAPL (LNAPL) was not observed in either of the two wells sampled during this RI. Groundwater level data was recorded on groundwater sampling field sheets that are provided in Appendix C. The average depth to groundwater is approximately 1-foot below the basement slab grade at Lot 7501. Groundwater was not encountered in the soil borings completed in the portion of Lot 1 that is part of the Site. Based on the proximity of the site to the Hudson River, regional groundwater flow is expected to be towards the west.

7.2 Soil Chemistry

Data collected during the RI is sufficient to delineate the vertical and horizontal distribution of contaminants in soil/fill at the Site. A summary table of data for chemical analyses performed on soil samples is included as Table 4 and shown on Figure 5.

No VOCs were detected above the NYSDEC Subpart 375-6 Restricted Residential Use Soil Cleanup Objectives (SCOs) in any of the samples collected at Lot 7501. Analytical results revealed an exceedance of the Unrestricted Use Objectives (UUOs) for the VOC acetone from 0- to 2-feet bgs in Lot 1 (0.057 mg/kg), a common laboratory artifact.

Analytical results revealed exceedances of the SCOs for SVOCs (specifically for polycyclic aromatic hydrocarbons [PAHs]) in the historic fill material from 0- to 2-feet below the basement slab in all soil samples collected at Lot 7501. Exceedances of the NYSDEC UUOs were identified for acenaphthene (25.4 mg/kg – 44.7 mg/kg). Exceedances of the NYSDEC Industrial RUSCOs were detected for lead (4,670 mg/kg – 4,830 mg/kg) from 3- to 9-feet bgs.

Conclusions

The soil analytical results of this RI documented exceedances of the NYSDEC Subpart 375-6 Restricted Use SCOs for SVOCs in all samples collected from below the basement slab at Lot 7501. In particular, exceedances of the NYSDEC Industrial RUSCOs for one or more PAHs in each of the six sample locations at which SVOCs were analyzed. Metals chromium and mercury were detected above the UUOs and/or Residential RUSCOs and lead was detected in exceedance of the Restricted Residential RUSCOs. In addition, pesticides were detected above the UUOs.

The soil analytical results also documented exceedances of the NYSDEC SCOs for PCBs in all samples collected from 0- to 2-feet bgs at Lot 1. Metals were also detected in exceedances of the SCOs in all samples collected at Lot 1. Specifically, lead was detected above the Industrial RUSCOs from 3- to 9-feet bgs.

As part of the proposed site development, excavation to a minimum depth of approximately 14- to 18-feet below sidewalk grade is expected. Historic fill material was documented from 0- to 3-feet below the existing basement slab of the onsite building at Lot 7501 and from 0- to 8-feet bgs in the portion of Lot 1 that is part of the Site. As the proposed excavation depth will exceed the depth of the fill material, all impacted historic fill will be excavated and transported for off-site disposal.

Handling and management of the soil will be conducted in accordance with a NYCOER approved Construction Health and Safety Plan and Remedial Action Workplan as part of the "E" designation requirements.

7.3 Groundwater Chemistry

Data collected during the RI is sufficient to delineate the distribution of contaminants in groundwater at the Site. A summary table of data for chemical analyses performed on groundwater samples is included in Table 5 and exceedances of applicable groundwater standards are shown on Figure 6.

Analytical results revealed no exceedances of the NYSDEC Part 703 groundwater quality standards (GQS) for VOCs, pesticides, or PCBs in any of the groundwater samples collected. The only SVOC identified above the NYSDEC Part 703 GQS is naphthalene in LMW-3 at a concentration of 19 ug/L. Metals were detected above the NYSDEC Part 703 GQS including iron at LMW-3 (1,360 ug/L) and LMW-4 (900 ug/L), magnesium at LMW-4 (38,000 ug/L) and the duplicate sample of LMW-4 (36,600 ug/L), selenium at LMW-4 (17.3 ug/L) and the duplicate sample for LMW-4 (16.8 ug/L), and sodium at LMW-3 (214,000 ug/L), LMW-4 (612,000 ug/L), and the duplicate sample for LMW-4 (641,000 ug/L). Dissolved metals were detected above the NYSDEC Part 703 GQS including dissolved magnesium at LMW-4 (37,800 ug/L) and the duplicate sample of LMW-4 (36,900 ug/L), dissolved selenium at LMW-4 (17.4 ug/L) and the duplicate sample for LMW-4 (17.2 ug/L), and dissolved sodium at LMW-3 (216,000 ug/L), LMW-4 (629,000 ug/L), and the duplicate sample for LMW-4 (612,000 ug/L).

Conclusions

Analytical results revealed no exceedances of the NYSDEC Part 703 GQS for VOCs, pesticides, or PCBs in any of the groundwater samples collected. An exceedance of the Part 703 GQS for the SVOC naphthalene was detected in LMW-3. Exceedances of the Part 703 GQS for total iron and total sodium were detected in both wells and an exceedance of the Part 703 GQS for magnesium and selenium were detected in LMW-4 and the duplicate sample collected at LMW-4. The detections of magnesium and sodium in groundwater are attributable to background conditions and the proximity of the site to the Hudson River and the detection of iron and selenium is likely attributable to elevated turbidity in the collected samples.

Dewatering is not anticipated the site redevelopment activities. However, if localized dewatering is required, these dewatering activities will be conducted in accordance with NYCDEP Sewer Discharge Criteria.

The potential for volatilization of low level concentrations of VOCs in groundwater to the proposed building was assessed via completion of a soil vapor assessment discussed below.

7.4 Soil Vapor Chemistry

Data collected during the RI is sufficient to delineate the distribution of contaminants in soil vapor at the Site. A summary table of data for chemical analyses performed on soil vapor samples is included in Table 6. Figure 7 shows the location and provides a summary of soil vapor sample results.

Although a fuel oil AST and potential gasoline UST are present at the site, petroleum-related VOCs will not be reviewed for the potential vapor intrusion concern (pVIC) evaluation for the purposes of this report as no VOCs were detected above applicable criteria in either soil or groundwater at the site. Therefore, only tetrachloroethylene (PCE) and trichloroethylene (TCE) will be considered for the pVIC evaluation.

The results for these compounds were compared to the indoor air quality criteria found in the New York State Department of Health (NYSDOH) 2003 Study of Volatile Chemicals in Air of Fuel Oil Heated Homes guidance and the United States Environmental Protection Agency (USEPA) 2001 Building Assessment and Survey Evaluation (BASE) Database using Summa Canister Method. The analytical results for Lot 7501 detected PCE in exceedance of NYSDOH guidance Upper Fence criteria and the USEPA BASE guidance 90th Percentile criteria in LSV-1 (13 ug/m^3) and LSV-5 (21 ug/m^3). TCE was not detected in any of the subslab samples collected. The analytical results for Lot 1 detected PCE in exceedance of NYSDOH guidance Upper Fence criteria and the USEPA BASE guidance 90th Percentile criteria in LSV-6 (28 ug/m^3) and LSV-7 (21 ug/m^3). TCE was not detected above the NYSDOH or USEPA criteria in any of the deep soil vapor samples collected. According to the Soil Vapor/Indoor Air Matrix 2 provided in the NYSDOH guidance, the PCE results for all samples collected indicate that no further action is required.

Conclusions

The analytical results detected PCE in exceedance of NYSDOH and the USEPA criteria in LSV-1 and LSV-5 through LSV-7. These exceedances when compared to the NYSDOH Vapor Intrusion, Matrix 2 guidance document identified that mitigation was not required; however, a vapor barrier will be installed below and along foundation walls as part of the proposed building redevelopment will adequately address the potential for soil vapor intrusion into the building.

7.5 Prior Activity

Based on an evaluation of the data and information from the RIR, disposal of significant amounts of hazardous waste is not suspected at this site.

7.6 Impediments to Remedial Action

There are no known impediments to remedial action at this property.

7.7 Schedule and Submittals

Redevelopment of the property is anticipated to begin in 2015. A Remedial Action Plan to address the hazardous materials portion of the (E)-designation will be provided within one week of the submittal of this Remedial Investigation Report.

***NYSDEC Groundwater Criteria are a combination of values from Part 703 if the NYS Code and TAGM 4046. Most values are generic screening values, however where contaminant specific criteria have been established they are used in this table.

Sample data were provided in the Phase II Investigation Report, 363 Bond Street by ELM dated May 2005.

Italicized results indicate values in which the reporting limit (RL) exceed the criteria.

J: Estimated value

U: Indicates that the result is lower than the RL.

^: the principal organic contaminant standard for groundwater of 5 ug/L applies to this substance. Value found in Table 1 of Part 703.5 Water Quality Standards Surface Waters and Groundwater NYSDEC

[1]: Value found in Table 1 of Part 703.5 Water Quality Standards Surface Waters and Groundwater NYSDEC

[3]: Value applies to the sum of cis- and trans-1,3-dichloropropene, CAS Nos. 10061-01-5 and 10061-02-6, respectively. Value found in Table 1 of Part 703.5 Water Quality Standards Surface Waters and Groundwater NYSDEC

---*: No value found. Substance listed in Table 3 of TOGS (Partial List of Substances Not Regulated By The Principal Organic Contaminant Groundwater Standard) June 1998

[4]: Value found in Table 1 of TOGS NYS Ambient Water Quality Standards and Guidance Values, June 1998. Value given as guidance value since no standard value was given

EXECUTIVE SUMMARY

This Phase I Environmental Site Assessment (ESA) was prepared Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C. on behalf of 525 West 52nd St Development, LLC c/o Taconic Investment Partners, LLC to identify current or potential environmental concerns and Recognized Environmental Conditions (RECs) at the 0.69-acre proposed development site consisting of the property at 525 West 52nd Street (Block 1081 Lot 7501) located in New York, New York. The ESA included a site inspection, review of historical information, completion of a federal/state/local environmental database search, and interviews with local and state agencies to assess current and past site conditions.

The subject property is currently occupied by a seven-story commercial/office building with a mezzanine and single basement level, and a loading dock area on the eastern side. The building is four-stories on the northern portion, seven-stories on the southern portion, and three-stories on the eastern portion. The parcel is located west of 10th Avenue on the north side of West 52nd Street in midtown Manhattan. According to historical records, the site was most recently used for printing/lithographic operations until 2009. With exception of the second floor which is being used for office space, the building is currently vacant. Additional addresses associated with the property include 523-531 West 52nd Street and 520-528 West 53rd Street.

Based on information obtained during the visual inspection of the subject property, review of environmental databases and historic information, and contact with federal/state/local official agencies, the following recognized environmental conditions (RECs) and business environmental risks that may impact proposed redevelopment of the site were identified:

Recognized Environmental Conditions

It is the opinion of the environmental profession that the following represent RECs:

Historic Use of the Subject Property

The subject property is identified by USEPA as a generator of non-listed ignitable hazardous waste and is documented for the disposal of hazardous waste. Historic operations at the subject property, as identified by the City Directory and Sanborn Fire Insurance Maps, include lithography, printing, photographic laboratory, and envelope manufacturing between approximately 1920 and 2012. Due to the potential use of chemicals associated with historic operations and the duration of these activities, it is the opinion of the environmental professional that the historic site use has the potential to impact subsurface conditions at the site. As such, the historic use of the subject property is considered a REC.

Surrounding Sites

Potential impacts from current and historical operations conducted at adjacent and nearby properties involving the generation of hazardous waste, the use of above-ground and underground storage tanks (ASTs, USTs), and documented open spills, represent a REC due to the potential for off-site migration of contaminants to impact the soil and groundwater beneath the subject site. Five spills located within 1/8-mile of the subject property remain open.

- Mobil Oil #17-JWN is identified in the NY LTANKS database under NYSDEC Spill No. 8904939. The spill was reported in 1989 due to a tank tightness test failure. In 2010 70,000 ppb of petroleum related volatile organic compounds (VOCs)were detected in groundwater along the western boundary of the site during a Phase II Environmental Investigation.

- Mobil Service Station HPD is identified in the NY Spills database under NYSDEC Spill No. 9308101. The release occurred in 1993, when petroleum was found seeping through a cellar wall adjacent to the gasoline station. An offsite contamination plume associated with the spill is being investigated and remediated to achieve spill closure.

- CBS Broadcasting is identified in the NY Spills database under NYSDEC Spill No. 0403162. The spill occurred when 6,000-gallons of oil was mistakenly delivered to a 1,000-gallon tank. A series of investigations and remedial actions including fluid and vapor extraction and quarterly groundwater monitoring were completed following the spill to address the effectiveness of the remedial efforts. The most recent round of groundwater monitoring documented the presence of 0.05-feet of free product present in one of the monitoring wells, and analytical results revealed the presence of low level dissolved VOCs.

- Commercial Building is identified in the NY LTANKS database under NYSDEC Spill No. 11000355. The spill was reported as the result of a tank test failure of a fuel oil storage tank. Repairs were attempted but failed and it was concluded that the tank should be taken out of service and removed.

- West 54th Street & 11th Avenue is identified in the NY Spills database under NYSDEC Spill No. 8905000. The spill occurred as the result of equipment failure and oil was observed to be entering the sewer. A Site Investigation Work Plan was reviewed by the NYSDEC in July 2012.

Several open NYSDEC spills have been identified within 1/8th-mile of the subject property that, according to the information provided in the EDR report, have documented off-site groundwater impacts that could affect the saturated soil and groundwater conditions beneath the subject property. Therefore, the presence of off-site impacts to groundwater from the above referenced sites present the potential for adverse environmental impacts to the subject property is identified as a REC..

Business Environmental Risks

It is the opinion of the environmental profession that the following represent business environmental risks:

Underground Gasoline Storage Tanks

A gasoline UST is identified on Sanborn Fire Insurance Maps at the southern end of the building from 1951 through 2005. A magnetic anomaly was identified at the southern end of the building during a subsurface investigation completed at the subject property in 2010. Analytical results of the subsurface investigation subsequently completed in the area of the UST revealed no volatile organic compounds (VOCs) above applicable criteria in soil or groundwater in the vicinity of the UST. Based on these findings a release from the UST has not been identified; however, removal of any USTs or associated piping will be required in conjunction with any future site redevelopment.

Historic Urban Fill

Laboratory analytical results of soil samples collected from shallow subsurface fill material at the site during Phase II Environmental Investigations identified impacts from poly-aromatic hydrocarbons (PAHs) and metals. Based on the analytical results and the classification of the soil, it is anticipated that the material between the base of the existing basement slab and bedrock will be characterized as non-hazardous impacted fill material and require proper handling and disposal during disturbance of the material during site redevelopment.

Aboveground Fuel Oil Storage Tank

The subject property is identified in the NY AST and NY HIST AST databases for the presence of a 7,000-gallon AST containing fuel oil. According to NYSDEC records, the AST is located in the basement of the building and vaulted. The AST was observed during site reconnaissance and minor staining was noted on the tank and concrete floor of the vault during Langan's site inspection. Based on the access limitations of this area the potential presence of unobserved leaking in other portions of the AST area, the AST is considered a business environmental risk.

Removal of the tank and any impacted concrete and underlying soil will be required during the proposed site redevelopment.

Additional Non- ASTM Issues

Asbestos

A limited asbestos survey of the onsite building was completed in 2010. Although none of the samples submitted for laboratory analysis confirmed the presence of asbestos containing materials (ACM), the report concluded that pipe-insulation and associated mudded joints and roofing materials that were not sampled during the survey were presumed to be ACM. A complete asbestos survey will be required prior to any proposed building demolition or renovation in order to assess all potential ACM.

Lead-Based Paint (LBP)

A limited LBP assessment was completed in 2010. The results of the field screening revealed that LBP was found in the onsite building in components such as walls, doors, door cases, pipe riser and columns, and laboratory analytical results further confirmed the presence of LBP. Proper handling and disposal of LBP disturbed during proposed building renovation or demolition will be required.

1.0 INTRODUCTION

Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C. (Langan) has completed a Phase I Environmental Site Assessment (ESA) of a ±0.69-acre site located at 525 West 52nd Street, New York, New York (Figure 1).

This ESA was conducted to identify current or potential environmental concerns and/or Recognized Environmental Conditions (RECs) resulting from past or current activities on the subject property, as well as to evaluate immediately surrounding environs with the potential to impact upon the property. The assessment consisted of a site reconnaissance of all accessible property areas, a review of State and Federal environmental databases as they concern the subject property and surrounding areas, contact with Federal, State and local agencies, a review of Sanborn Fire Insurance Maps of the subject property and surrounding areas, and a review of local/county records.

The ESA was conducted in a manner consistent with industry standard and practice and in accordance with the Standards of the American Society for Testing and Materials (ASTM) E1527-05 Standard Practice for Environmental Site Assessments. Any deviations from this practice are provided in Section 11.0 of this report.

No exploratory borings, sampling of soil, soil vapor, or groundwater, or laboratory analysis were performed by Langan as part of the scope of services.

This Phase I ESA was not intended to be a definitive investigation of possible environmental impacts at the subject property. The purpose of this investigation was limited to determining if there is reason to suspect the possibility of Recognized Environmental Conditions (RECs) at the subject property. It should be understood that even the most comprehensive Phase I ESA may fail to detect environmental liabilities at a particular site. Therefore, Langan cannot "insure" or "certify" that the subject property is free of environmental impacts. No expressed or implied representation or warranty is included or intended in this report, except that our services were performed, within the limits prescribed by our client, with the customary thoroughness and competence of our profession. The user is cautioned that federal, state, and local laws may impose environmental obligations that are beyond the scope of ASTM Practice E 1527-05.

The conclusions, opinions and recommendations provided in this report are based solely on the following activities:

- Visual observations of the subject property and the immediate vicinity at the time of Langan's site visit;
- Review of relevant available historical information; and,
- Correspondence and/or discussion with personnel knowledgeable about the site.

The conclusions, opinions and recommendations are intended exclusively for the purpose stated herein, at the specified subject property, as it existed at the time of our site visit.

The User is responsible for the review and identification of environmental liens, activity, and use limitations, and for ascertaining reasons for significantly lower purchase property price in accordance with Section 6 of ASTM E 1527-05. A questionnaire covering these above-concerns was provided to Taconic and is included as Appendix A. 3.0 SITE DESCRIPTION

The subject property is designated as Block 1081, Lot 7501 by the New York City Department of Finance (Figure 2). Additional addresses associated with the property include 523-531 West 52nd Street and 520-528 West 53rd Street. The site contains a commercial/office building with a basement and a loading dock area on the eastern side. The northern portion of the building is four-stories, the southern portion is seven-stories, and the eastern portion is three-stories.

The subject property is bounded to the north by West 53rd Street followed by a 30-story mixed use residential and commercial building located at 758 11th Avenue and a multi-story AT&T, Inc. utility building located at 501-517 West 53rd Street, to the east by a 25-story mixed use residential and commercial building located at 500 West 53rd Street, to the south by West 52nd Street followed by an 8-story residential building located at 535 West 51st Street, and to the west by a vacant lot and a new residential Clinton Housing Development building located at 533-547 West 52nd Street. The subject

property is located within an area of dense residential/commercial development in the Clinton/Hell's Kitchen district of Manhattan.

The property is currently zoned as a manufacturing district (M1-5) according the New York City Department of City Planning zoning map dated 06 February 2013. According to the New York City Department of Building the subject property is located in the Special Clinton Zoning District.

4.0 GEOLOGIC AND HYDROGEOLOGIC CONDITIONS

For the purpose of report completeness and to better understand the subsurface conditions, the geologic conditions in the general area of the subject property are discussed in this section.

The "Geologic Map of New York City and Adjacent Part of New Jersey" by U.S. Geological Survey indicates the bedrock underlying the site is part of the Hartland Formation. The Hartland Formation is comprised of a dark gray, medium to coarse-grained muscovite-biotite-garnet (mica) schist and gray fine-grained quartz-feldspar granulite with biotite and garnet, with localized concentrations of granite and intrusions of coarse-grained granitic pegmatite. The predominant feature of the Hartland Formation is the parallel alignment of the mineral grains, referred to as schistosity of foliation. The foliation in the Hartland Formation generally dips steeply to the west or the east depending on local conditions of folding, although foliation dipping to other directions or nearly horizontal foliation has been observed.

The subject property is located approximately 1/4-mile east of the Hudson River. The area of the subject property is underlain by shallow layers of fill and glacial deposits that may extend to about 17 feet below ground surface (b.g.s.).

Test borings completed in the vicinity of the subject property by Langan in 2000 indicate that subsurface conditions generally consist of an approximate three foot thick layer of miscellaneous fill underlain by successive layers of glacial deposits, decomposed rock, and mica schist bedrock. Rock was typically encountered at depths of approximately 7 to 17 feet b.g.s. Groundwater was encountered at approximately 8 to 9 feet b.g.s. Based on site/area topography, groundwater flow within the overburden material is anticipated to be to the west, towards the Hudson River.

Investigations completed by Langan near the subject property also indicate that lenses of serpentine have been observed in bedrock north of the Site. Serpentinite consists of hydrous minerals, some of which are fibrous and asbestiform. Langan investigations north of the Site have yielded evidence of chrysotile, an asbestiform mineral, in varying concentrations within serpentinite.

5.0 USER PROVIDED INFORMATION

A questionnaire was completed by the User and is included in Appendix A. Information obtained from this questionnaire is discussed in the sections below. In addition, documents provided by the User are also discussed in this section.

5.1 Title Records

A Title Search was not provided by the User for this ESA; however, Langan reviewed information maintained online by the New York City Department of Finance (NYCDOF) for title records. No ownership records are available from the NYCDOF for the subject property. According to OASIS (http://www.oasisnyc.net/map.aspx) the current owner is identified as Apple Industrial Condominium.

5.2 Environmental Liens or Activity and Use Limitations

Reasonably ascertainable recorded land title records and lien records that are filed under federal, tribal, state, or local law should be reviewed to identify environmental liens or activity and use limitations, if any, that are currently recorded against the property. Any environmental liens or activity and use limitations are required to be reported to the Environmental Professional conducting the ESA per ASTM E1527-05.

No environmental liens or use limitations (engineering or institutional controls) were identified for the subject property in the title report, EDR report, or by the User. Information regarding the 'E'-designation status of the property can be found in Section 8 of this report.

5.3 Specialized Knowledge

Specialized knowledge is defined by ASTM E 1527-05 as *"any specialized knowledge or experience that is material to recognized environmental conditions in connection with the property*". For example, a User is involved in the same

line of business as current or former occupants of the property or adjoining property and has specialized knowledge of the chemicals and processes used in this line of business.

The User did not provide specialized knowledge material to recognized environmental conditions in connection with the property as part of this ESA.

5.4 Valuation Reduction for Environmental Issues

In a transaction involving the purchase of a parcel of commercial real estate, the User shall consider the relationship of the purchase price of the property to the fair market value of the property if the property was not affected by hazardous substances or petroleum products. The User should try to identify an explanation for a lower price which does not reasonably reflect fair market value if the property were not contaminated.

No information related to a valuation reduction for environmental issues was provided to Langan.

5.5 Commonly Known Information

If the user is aware of any commonly known or reasonably ascertainable information within the local community about the property that is material to recognized environmental conditions in connection with the property, it is the User's responsibility to communicate such information. This information may include past uses of the property, specific chemicals that were used on site, spills or releases or environmental cleanups that have taken place.

No additional information regarding the environmental condition of the subject site was provided to Langan.

5.6 Documentation Provided by the User

The User provided Langan with the following historic environmental reports prepared for the subject property.

Phase I Environmental Site Assessment prepared by Environmental Management Solutions of New York, Inc. (EMSNY), dated May 20, 2004

EMSNY completed a Phase I Environmental Site Assessment on behalf of Newmark Realty. The Phase I ESA report documented activities conducted at the time of the inspection to include small scale printing and lithography with paper and printing products storage and I office use. The site walkthrough completed by EMSNY identified containers of photography chemicals, inks, and containers of alcohol (associated with printing processes), as well as unlabeled 3-5 gallon containers containing unknown liquids, and a 55-gallon drum with a hazardous waste label that was determined to contain waste alcohol generated during printing press cleaning activities. A 7,500-gallon oil storage tank was observed in the basement of the building. Ink stains were observed in areas where printing activities were conducted and oil staining was observed on the basement floor in the boiler area. EMSNY indicated that residual hazardous waste from printing processes may be onsite and cited this as a REC. Suspect asbestos containing materials (ACM) were observed during the site inspection conducted during the ESA. Additionally, the report noted that lead-based paint (LBP) was suspected at the property due to the age of the structure.

Phase II Subsurface Investigation prepared by General Consolidated Industries, Inc. (GCI), dated June 2, 2006

GCI completed a Phase II Subsurface Investigation on behalf of Commerce Bank, N.A. The Phase II report references a Phase I ESA report, dated May 5, 2006 that was completed by GCI. Although a copy of this Phase I report was not provided by the User as part of Langan's ESA, the Phase II provided a summary of RECs that were identified in the Phase I. The Phase I identified the potential for accidental spills and/or illegal discharges during photographic developing and printing operations at the site, both at the time of inspection and historically. Based on GCI's historical records review, a gasoline tank was located at the site from circa 1951 until at least 1996 and there was concern that an undocumented storage tank was located at the subject site. GCI completed a series of dye tests to identify discharge points for slop sinks, bathrooms, sump pits, floor and trench drains, and printer drainage and a geophysical investigation to identify possible USTs at the site. The results of the dye testing confirmed that five slop sinks, the bathrooms, three printer drainage points, and three of the sump pits are connected to the New York City sewer system and that no further work was required to confirm they were connected to the sewer system.

The connection of six of the drainage points could not be confirmed due to the structures being clogged. Two floor drains were reported to be connected to a buried leaching "drywell", although the location of the drywell was not identified. GCI recommended that the clogged structures be pumped out, cleared of debris, and power jetted to clear the structures and the piping. The results of GCI's geophysical investigation and site inspection did not identify any magnetic anomalies that would be indicative of an underground storage tank (UST) or evidence of storage tanks (i.e., patched areas, fill ports, vent lines, manways).

Limited Lead-Based Paint Inspection Report prepared by Precision Environmental, Inc. (Precision), dated November 10, 2010

Precision completed limited lead-based paint (LBP) testing at the site in early November 2010. The testing was performed using an X-Ray Fluorescence (XRF) analyzer with confirmatory paint chip sampling and in accordance with USEPA and United States Housing and Urban Development (USHUD) protocol. Paint testing was limited to painted surfaces within accessible areas of the 7-story and 4-story buildings at the site and areas where Precision was provided access. A total of 218 XRF readings were collected from randomly selected painted surfaces within the accessible areas of buildings, basement, loading and garbage areas at the subject site. The results of XRF field screening revealed that LBP was found in the buildings in components such as walls, doors, door cases, pipe riser and columns, and laboratory analytical results further confirmed the presence of LBP. Based on the presence of LBP at the subject site, Precision provided a detailed list of areas where LBP abatement precautions should be followed during any modernization or renovation activities. Precision also recommended confirmatory sampling at the completion of every construction activity even in areas where levels of lead were found to be beneath regulatory levels.

Limited Asbestos Survey and Abatement Cost Estimate of ACM and LBP prepared by Precision, dated November 16, 2010

Precision completed a limited asbestos survey in conjunction with the LBP testing in early November 2010. The asbestos testing included collection of 25 samples of suspect ACM at the site, including pipe insulation, roofing materials, gypsum board, gray mastic, cinderblock mortar, brick mortar, ceiling tiles, floor tiles and other materials. The report also identified concealed piping insulation

and roofing materials as presumed ACM. Based upon the ACM and LBP surveys and testing completed, Precision recommended completion of a comprehensive asbestos and LBP survey and bulk sampling prior to any site demolition.

Limited Due Diligence Investigation Report prepared by Fleming Lee Shue, Inc. (FLS), dated December 20, 2010

FLS completed a limited due diligence investigation on behalf of Taconic Investment Partners, L.L.C. in November/December 2010 that consisted of a site visit to observe evidence of potential contamination associated with historic use of the site, a review of historic Sanborn maps for the site and surrounding properties to determine the types and dates of historic activities that may have impacted the property, a geophysical survey to determine the potential presence of USTs shown on the 1951 Sanborn map, and a limited subsurface investigation that included the installation of nine soil borings and two temporary well-points to allow for the collection of soil and groundwater samples for laboratory analysis. The site walk-through identified two cut-off pipes at the southern end of the sub-cellar associated with two vent pipes observed on the roof top of the building and a suspected fill port at the west side of the boiler room. Additionally, several floor drains were observed in the sub-cellar area (one with signs of damage and discharge of unknown liquids to the subsurface), an active oil tank and boiler were identified in the eastern portion of the sub-cellar and fuel oil stains were observed around a suspected fill port on the south side of the boiler room, and oil staining was noted on the floor in the southeast corner of the sub-cellar where the fill line enters the building (52nd Street side).

The geophysical survey detected magnetic anomalies indicative of buried USTs in the southern portion of the sub-cellar as well as other anomalies in the same area. Soil borings were completed in the vicinity of the potential buried UST, floor drains, the boiler room, and an area of stained soil within the basement. The results of soil sampling were compared to NYSDEC Technical and Administrative Guidance Memorandum (TAGM) Recommended Soil Cleanup Objectives (RSCOs) and revealed the presence of semi-volatile organic compounds (SVOCs), zinc, and mercury at concentrations above their respective RSCOs. Based on the type of SVOCs identified, FLS concluded that the concentrations of compounds such as, benzo(a)anthracene, benzo(a)pyrene as well as others, were related to the presence of urban historic fill beneath the

site. The soil sampling also identified the presence of slightly elevated levels of mercury and zinc in two soil samples collected from floor drain areas. The results of groundwater sampling did not reveal the presence of VOCs in either sample collected. Several SVOCs were identified in the groundwater samples collected from the boiler room area and stained soil area and FLS concluded that the presence of SVOCs in the boiler room groundwater sample was likely petroleum related and the presence of SVOCs in the stained soil area sample was likely related to sediment in the groundwater sample.

Phase I Environmental Site Assessment prepared by AKRF, Inc., dated July 3, 2012

AKRF completed a Phase I Environmental Site Assessment on behalf of the Clinton Housing Development Company for the addresses at 530-548 West 53rd Street, 543 West 52nd Street, and 525 West 52nd Street. RECs identified with the 525 West 52nd Street address included the following:

- Historical use of the subject site for printing operations and manufacturing;
- The subject site was listed in the regulatory databases as a generator of hazardous wastes for the production of waste streams, including ignitable wastes, corrosive wastes and silver associated with former printing operations;
- The subject site was listed in the NYSDEC Spills database with two closed regulatory status spills;
- A reference to the FLS report and the findings of the limited subsurface investigation detailed above.

The AKRF Phase I report also referenced the 7,000-gallon No. 2 fuel oil AST in the basement of the subject site, and potential for ACM, LBP, and PCBs in building materials and equipment. Off-site historic RECs identified by AKRF included automotive facilities, gasoline storage tanks, a welding shop, a filling station associated with a migrating contaminant plume, a taxi repair facility, several repair shops and metal works facilities, and manufacturing businesses.

AKRF's recommendations following their due diligence included a subsurface investigation with laboratory analysis of soil, soil vapor, and groundwater samples.

Based on the large number of sites identified within one mile of the subject property (734), Langan limited the review of surrounding properties to sites within 1/8-mile from the subject property. It is the environmental professional's opinion that based on the dense development of the site area, and former, current and proposed use of the site that the review of the database pertaining to this more limited area is appropriate. Langan evaluated the following to determine whether additional environmental records with respect to these facilities, including the orphan sites, should be reviewed:

- Case status (i.e., whether a No Further Action letter has been issued or a case has been closed);
- Type of database and whether the presence of soil or ground water contamination is known;
- Distance of the site from the subject property; and,
- Whether the site is upgradient or downgradient of the subject property based on local topography and the anticipated western groundwater flow direction.

Langan reviewed the information provided using the above criteria and the findings are discussed below.

Subject Properties

The subject property is identified in the NY MANIFEST, RCRA LQG, RCRA NonGen, NY AST, NY HIST AST, ERNS, NY Spills, and FINDS databases. These listings are discussed below.

(NYSDEC) on 4 January 2000 and assigned NYSDEC Spill No. 9911542. The spill was reported when 25-gallons of transformer oil was found floating on approximately 75-gallons of water in vault 3484. Contamination of the sewer was suspected however, the dropping water level in the vault was attributed to a drain in the vault. A tanker truck was dispatched to the site to drain the transformer and the spill was administratively closed on 17 March 2000.

Based on the records provided in the RCRA LQG and NY MANIFEST database identifying the generation and disposal of hazardous waste as a result of former operations, it is the opinion of the environmental professional that historic use of the subject property represents and REC. Based on the closed status of the spills and their location in a vault in the road adjacent to the subject property it is the opinion of the environmental professional that these spills do not represent an REC.

NY Spills & NY Hist Spills

The NY Spills and NY Hist Spills databases include data collected on spills reported to NYSDEC. It includes spills active as of April 1, 1986, as well as spills occurring since this date. The NY Hist Spills database contains records of chemical and petroleum spill incidents prior to 2002.

According to EDR, there are 48 NY Spills sites located within 1/8-mile of the subject property. Of these, the following are either adjacent to the subject property or remain open:

- Vacant Lot – 770 11th Avenue
- In Parking Lot – 766 11th Avenue
- Apartment Building – 535 West 51st Street
- Former Verizon Facility – 770 11th Avenue
- AT&T Web Hosting & Commercial Operations – 811 10th Avenue
- In Front Of – 811 10th Avenue
- Apartment Building – 501 West 51st Street
- Mobil Service Station HPD – 535 West 51st Street
- CBS Broadcasting – 857 10th Avenue
- West 54th Street & 11th Avenue – West 54th Street & 11th Avenue

Mobil Service Station HPD located approximately 319-feet to the east and upgradient of the subject property at 783 10th Avenue is identified in the NY Spills database for three closed spills and one open spill. According to the NYSDEC case narrative that was provided in the EDR report, the active spill (NYSDEC Spill No. 9308101) refers to a release in 1993, when petroleum (determined to be gasoline containing methyl tertiary butyl ether, a gasoline additive) was found seeping through a cellar wall

adjacent to the gasoline station. This listing was used to consolidate other spills and remediation details reported at the site. Three closed-status spills occurred at the site between 1990 and 1998 and were associated with fueling operations and tank test failures that occurred at the former on-site gasoline station. According to the database information, this site entered into the Brownfield Cleanup Program (BCP) and a DEC-approved Remedial Action Plan (RAP) was initiated which included the excavation of soil to bedrock across the entire site and the implementation of a groundwater treatment and monitoring regime. An offsite contamination plume was also being investigated and remediated to achieve spill closure. Oxygen reduction compound (ORC) was administered to several of the monitoring wells and followed with quarterly groundwater monitoring events. As of October 2012, the groundwater analytical data revealed exceedances of the groundwater quality criteria in two of the wells used to monitor the offsite plume. The spill remains open.

CBS Broadcasting located approximately 327-feet to the southeast and upgradient of the subject property at 857 10th Avenue is identified in the NY Spills database for an incident that was reported to the department on 19 June 2004 and assigned NYSDEC Spill No. 0403162. According to the NYSDEC case narrative that was provided in the EDR report, the spill occurred when 6,000-gallons of oil was mistakenly delivered to a 1,000-gallon tank. The oil overflowed into the basement of the building and some was discharged through floor drains. Three Areas of Concern (AOCs) were identified associated with the spill – the basement of the building in which the spill occurred (AOC #1), the basement of the neighboring building into which the oil was seeping (AOC #2), and the basement of another nearby building into which the oil was seeping (AOC #3). A series of investigations and remedial actions including fluid and vapor extraction systems and quarterly groundwater monitoring were completed following the spill. The most recent round of groundwater monitoring documented in the NYSDEC narrative was completed in April 2012 and documented the presence of 0.05-feet of free product present in one of the monitoring wells and analytical results revealed the presence of low level dissolved VOCs. The monitoring report recommended continuing bi-annual monitoring of wells with removal of free product via well purging as needed. The spill remains open.

West 54th Street & 11th Avenue is identified in the NY Spills database for an incident that was reported on 20 August 1989 and was assigned NYSDEC Spill No. 8905000. According to the NYSDEC case narrative that was provided in the EDR report, the spill occurred as the result of equipment failure and oil was observed to be entering the

sewer. A Site Investigation Work Plan was reviewed by the NYSDEC in July 2012. The spill remains open.

Vacant Parking Lot, In Parking Lot, Apartment Building, Former Verizon Facility, AT&T Web Hosting & Commercial Operations, In Front Of, and Apartment Building are discussed in detail above.

NY BROWNFIELDS

According to the EDR report, the only NY Brownfields site located within 1/8-mile of the subject property is the Off-Site Clinton Redevelopment Project located approximately 440-feet to the southeast and upgradient of the subject property at 51st Street through 53rd Street and 10th Avenue. The site involves a shallow off-site petroleum-contaminated groundwater plume which is present as the result of spills associated with the former ExxonMobile Service Station (NYSDEC Spill No. 9308101) and is part of the Clinton Green Urban Renewal Area. The on-site source area was cleaned up in 2006 and the primary contaminants are petroleum-related volatile organic compounds (VOCs) including benzene. The contaminant plume has migrated approximately 100-feet downgradient of the site and is limited due to the geology of the area.

RCRA Non-Generators (NonGen)

The RCRA NonGen database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). RCRA Non-Generators do not currently generate hazardous waste.

Government Databases Review Conclusions

The following sites (described in detail above) could potentially impact subsurface conditions (soil and groundwater) at the subject property and may pose a moderate risk to the subject property and future redevelopment activities:

- 770 11th Avenue
- 811 10th Avenue
- 718 11th Avenue (Mobil Oil #17-JWN Mobil)
- 857 10th Avenue (CBS Broadcasting)

Due to historic operations including hazardous waste disposal and numerous and large volume spills that remain open at the sites identified above, there is potential for environmental impacts to the subject property from these sites. It is the opinion of the environmental professional that this represents a recognized environmental condition.

8.0 GOVERNMENT AGENCY RECORDS REVIEW

Federal, state and local agencies were contacted via written correspondence, telephone interviews and/or personnel interviews regarding records of environmental concerns, violations, and/or permits, or any other potentially environmentally-relevant records on the subject property. In additional, government information that was readily available online on government websites was also reviewed. A listing of agencies/individuals contacted by Langan as part of this ESA is provided in Table 1. Copies of government correspondence are provided in Appendix F.

'E'-Designation Status

The New York City Department of City Planning coordinated a program identifying properties for special environmental concerns based on documented historical use, neighborhood noise concerns, and neighborhood air quality issues. These properties are identified on 'E'-designated sites on zoning maps and in the NYC Department of Buildings (NYC DOB) Building Information System (BIS) database. The NYCDOB is restricted from issuing building permits for the property until the NYC Mayor's Office of Environmental Remediation (NYC OER) has reviewed information prepared by an environmental professional and made a determination to issue of "Notice-of-No-Objection" or a "Notice-to-Proceed" to the NYCDOB. Prior to the NYCOER's creation in 2008, the NYC Department of Environmental Protection (NYCDEP) conducted these reviews.

Langan reviewed the following information sources to determine if the subject property is listed as an 'E'-designated property: CEQR Environmental Designations List dated 10 July 2013 (http://www.nyc.gov/html/dcp/pdf/zone/appendixc.pdf) and NYCDOB BIS on 5 August 2013 (http://a810-bisweb.nyc.gov/bisweb/bispi00.jsp). The subject property was not listed as an E'-designated site based on these resources.

New York City Office of Environmental Coordination (NYC OEC)

Dr. Robert Kulikowski, director of the New York City Mayoral Office of Environmental Coordination, was contacted by Langan and a written file review request was submitted

for the subject property. To date, no response has been received by Langan regarding this request. If any additional pertinent information is provided subsequent to issuance of this report, it will be provided as an addendum.

New York City Department of City Planning (NYC DCP)

An electronic version (effective zoning date 8 February 2013) of the NYC Zoning Map for the subject property was downloaded from the NYC DCP website (http://www.nyc.gov/html/dcp/html/zone/zh_zmaptable.shtml).

New York City Office of Environmental Remediation (NYC OER)

The NYC OER Searchable Property Environmental E-Database (SPEED) was reviewed. Information regarding the date of building construction, building details including number of floors and dimensions, and land use were obtained. In addition, alternate address listings and lot dimensions were obtained.

Fire Department of New York City (FDNY)

Information regarding the presence of petroleum or chemical storage tanks was requested from the FDNY. According to the FDNY, there is a 7,500-gallon tank containing No. 4 fuel oil present at the subject property. Additionally, multiple violations are on record for the subject property, including a violation for the sale/storage/use/ manufacturing of a material without a permit in September 2011. The type of material is not identified.

New York City Department of Buildings (NYC DOB)

Langan completed a limited review of available online records maintained by the NYC DOB. Certificates of Occupancy were available for the subject property from 1929 through 2012. The most recently Certificate of Occupancy dated 19 December 2012 indicates that the building on the subject property is approved for manufacturing in the basement and mezzanine, commercial vehicle storage on the first floor, and manufacturing and accessory offices on the second through seventh floors. Additionally, fuel oil burner applications were filed for the subject property in 1950 and 1974. Records for three commercial low pressure boilers are provided by the NYC DOB, all of which are listed as being active and located in the basement of the building. New building applications were filed for the subject property in 1928, 1950, and 1953.

According to the NYC DOB the subject property is located in the Special Clinton Zoning District which was created to preserve and strengthen the residential character of a community bordering Midtown maintain a broad mix of incomes, and ensure that the community is not adversely affected by the new development.

New York City Department of Finance (NYC DOF)

Langan completed a limited review of available online records maintained by the NYC DOF to determine current and former site ownership. No ownership records are available from the NYCDOF for the subject property.

9.0 SITE RECONNAISSANCE

Langan conducted an inspection of the site on 28 June 2013. The inspection included a walk-through inspection of the entire site for the purposes of identifying Recognized Environmental Conditions (RECs). Typical RECs may include:

Drum storage	Dumpsters	Aboveground storage tanks	Stained areas
Drains and Sumps	Wells	Underground storage tanks	Pump stations
Waste piles	Landfills	Loading and transfer areas	Boiler rooms
Pits, Ponds, Lagoons	Swales	Process air vents	Process sinks
Storm sewers	Trenches	Detention ponds	PCBs
Impoundments	Lagoons	Floor drains and piping	Transformers
Septic systems	Dry wells	Waste treatment areas	Capacitors
Rail spurs	Incinerators	Compressor discharges	Odors
Pools of liquid	Wastewater	Stressed vegetation	Surface waters

Limiting conditions encountered during the inspection of the site included the following:

- Due to the storage of construction materials in the basement, visual inspection of the basement floor was limited;
- Due to the location of the fuel oil tank within a vault, inspection of the vault floor was limited to the area visible from the access hatch; and,
- Visual inspection of the floor in the limousine parking garage was limited based on the number of cars parked.

A visual inspection of adjoining properties from the subject property line, public rights-of-way or other vantage point (e.g. aerial photography) including a visual inspection where hazardous substances may be or may have been stored, treated, handled or disposed was also conducted.

Limiting conditions encountered during the inspection of adjoining properties were encountered due to the dense urban nature of the surrounding areas which only allowed for limited line of sight that did not extend to areas where hazardous materials or substances might be stored.

Photographs of the subject property taken during the site inspection are provided in Appendix G. Langan was accompanied by Daniel McInerney who provided access to onsite buildings and answered questions during the site inspection. A questionnaire was completed by the property owner and is included as Appendix B. The inspection included a walk-through inspection of the entire site for the purposes of identifying Recognized Environmental Conditions (RECs) as detailed below.

The site is occupied by a commercial/office building with a concrete slab and concrete foundation wall basement and a loading dock area on the northeastern side. The superstructure of the building is constructed of steel and masonry. The building is constructed with a flat roof with a built up rubber roofing material. The northern portion of the building is four stories, the southern portion is seven-stories, and the eastern portion is three stories.

The basement of the building is accessible from the 53rd Street side via a concrete ramp and from a stairway on the southern side of the building. The southwestern portion of the basement is occupied by the ramp and the southeastern portion is currently occupied by a steel rack storage system that contains construction supplies and small gasoline and electrically powered equipment. Several one to five-gallon containers of solvents and petroleum products were observed; however, the containers appeared to be in good condition and the concrete floors in the vicinity of these storage areas were observed to be in good condition and no areas of staining were observed.

The remaining central and southern portions of the basement were used as a vehicle parking area, and an electrical and mechanical equipment storage. The basement floor is constructed with a concrete slab that was observed to be in fair condition; however, several areas of sunken or cracked concrete were observed. These areas appeared to be associated with the former industrial uses of the facility. Additionally, several of the areas where the concrete was observed to be disturbed were also identified by the previously conducted geophysical survey. Disconnected piping within one of these areas is likely associated with underground storage tanks (UST) that was previously

identified on the southern portion of the parking area of the basement. It is assumed that this UST area is the gasoline UST that is identified in the 1951 Sanborn Map.

The mechanical equipment storage area was observed to contain two fuel oil fired boilers and one natural gas fired boiler. Fuel oil for the boiler is supplied by a 7,500-gallon No. 2 fuel oil AST that is located within a concrete block vault. This AST was observed through the access door of the vault, the floor of the vault is constructed of concrete; although the entire floor beneath the AST wasn't inspected due to site constraints the area that was observable was stained with fuel oil. The basement also contained electrical equipment and utility meters. Additionally, the mechanical equipment storage area was also observed to contain several sump pits that were observed to contain water, no sheens or stains were observed in the sumps.

The structure contained one passenger elevator and three freight elevators. The building is heated with a combination of natural gas and a No. 2 fuel oil-fired boiler system.

The ground floor of the building is occupied by a limousine company parking area on the ground floor and the lobby for the former office and printing operations. No staining or areas of hazardous materials storage were observed on the first floor of the building. A vent pipe and suspected fill port were observed within the sidewalk of the 52nd Street frontage side of the building. This vent pipe and fill port are assumed to be associated with the 7,500-gallon fuel oil AST.

The second floor of the building contained office space that was partially occupied and manufacturing space that was vacant. The remaining upper floors of the building contained vacant manufacturing areas and accessory offices. Air conditioning for each of the upper floors was supplied by individual electric air conditioning units. The floors of the former manufacturing or printing operations were observed to be in fair condition, however, areas of staining were observed. These areas were not in the vicinity of any floor drains; therefore, impacts to soil or groundwater are not expected from these areas where it is likely that hazardous materials may have been released in small quantities.

Adjacent Properties

Properties located adjacent to the subject property consist of commercial and residential buildings. No other visual evidence of hazardous material storage, treatment, handling, or disposal areas was observed at adjacent properties.

10.0 ADDITIONAL ISSUES

The following items fall outside the scope of ASTM 1527-05, however Langan can and often does provide these services to its clients if specifically requested and included in the proposed scope of work or are issues that may impact current or proposed site use.

10.1 Wetlands/Floodplain Designation

A wetland and floodplain designation assessment was not conducted as part of this ESA.

10.2 Protected Endangered Species / Critical Habitats

A determination regarding the potential presence of protected or endangered species and critical habitats on or near the subject property was not conducted as part of this ESA. This determination is often required in order to receive state or federal grants, loans, and/or permits.

10.3 Asbestos

In 1973, use of sprayed on fireproofing on structural building components was prohibited by the EPA. On July 12, 1989, EPA issued a final rule banning most friable asbestos-containing products. The following specific asbestos-containing products remain banned: flooring felt, roll board, and corrugated, commercial, or specialty paper. In addition, the regulation continues to ban the use of asbestos in products that have not historically contained asbestos, otherwise referred to as "new uses" of asbestos. Use of asbestos in textured paint and in patching compounds used on wall and ceiling joints was banned in 1977. An asbestos inspection was not conducted as part of this ESA, however, a limited asbestos survey was completed by Precision Environmental Inc. in November 2010.

The asbestos testing completed by Precision included the collection of 25 samples of suspect ACM at the site including pipe insulation, roofing materials, gypsum board, gray mastic, cinderblock mortar, brick mortar, ceiling tiles, floor

tiles and other materials. Based on the survey and testing, Precision concluded with the assumption that pipes within wet columns are insulated with ACM insulation and the roofing materials are ACM. Based upon the ACM survey and testing completed, Precision recommended a comprehensive asbestos survey and bulk sampling prior to any site demolition in accordance with applicable asbestos and lead rules and regulations to identify and quantify all ACM associated with the site.

10.4 Lead-based Paint

In 1977, the Consumer Product Safety Commission (CPSC) banned the use of lead based paint (LBP) in housing and restricted maximum levels in lead in new residential paint to less than 0.05% by weight. Based on the age of the onsite building, there is a potential that LBP is present in the onsite building. A lead-based paint inspection was not conducted as part of this ESA, however, a limited LBP assessment was completed by Precision in November 2010.

The LBP testing was performed using an X-Ray Fluorescence (XRF) analyzer with confirmatory paint chip sampling and in accordance with USEPA and United States Housing and Urban Development (USHUD) protocol. Paint testing was limited to painted surfaces within accessible areas of the 7-story and 4-story buildings at the site and areas where Precision was provided access. A total of 218 XRF readings were collected from randomly selected painted surfaces within the accessible areas of buildings, basement, loading and garbage areas at the subject site. The results of XRF field screening revealed that LBP was found in the buildings in components such as walls, doors, door cases, pipe riser and columns, and laboratory analytical results further confirmed the presence of LBP. Based on the presence of LBP at the subject site, Precision provided a detailed list of areas where LBP abatement precautions should be followed during any modernization or renovation activities. Precision also recommended confirmatory sampling at the completion of every construction activity even in areas where levels of lead were found to be beneath regulatory levels.

10.5 Lead in Drinking Water

A lead in drinking water survey of the existing building was not conducted as part of this ESA.

10.6 Indoor Air / Microbial Assessment (Mold)

A mold survey of the existing building was not conducted as part of this ESA.

10.7 Radon

The subject property is located in a Tier 3 Zone as identified by USEPA based on sampling conducted of buildings within the site area. The Tier 3 Zone is considered an area of low radon gas intrusion potential with typically concentrations less than 2 pCi/liter. A radon survey of the existing building was not conducted as part of this ESA. Radon test results from adjacent or surrounding properties are not necessarily indicative of radon conditions on the subject property. As no building specific radon survey documentation was provided to Langan, no opinion regarding potential risks associated with radon gas exposure can be made.

As per USEPA guidelines, the only way to assess potential radon gas exposure risks is to conduct a radon assessment. In addition, the US EPA recommends that follow-up tests on large buildings should be conducted when major modifications are made either to the building structure or HVAC system or the HVAC system's operation settings.

10.8 Historical and Archaeological Review

A determination regarding the potential presence of historical landmark buildings and/or archaeologically valuable sites on or near the subject property was not conducted as part of this ESA. This determination is often required to receive state or federal grants, loans, and/or permits.

11.0 DEVIATIONS

This Phase I ESA conforms with ASTM with the following deviations noted:

- Property use was only determined back to 1892, not to first development, as historical property records were not reasonably available;
- Data gaps in excess of 5 years were encountered during the review of historic resources;

- Based on the large number of sites identified within one mile of the subject property (734), Langan limited the review of surrounding properties to sites within 1/8-mile from the subject property;
- An assessment of the current property value versus the proposed sale price of the property was not completed as this information was not provided by the User;
- Government agencies that have not responded to record review inquiries are listed above. Additional pertinent information provided to Langan subsequent to the issuance of this report will be provided in an addendum.
- Interviews of former business operators were not conducted;
- Interviews of property owners were not conducted;
- Questionnaires were not completed by the property owner, operator, or site manager;
- Limited access was provided to the AST area due to site constraints as part of this ESA access as identified in Section 9.0;

It is the opinion of the reviewing Environmental Professional that the above-deficiencies will not detrimentally affect the identification of potential recognized environmental conditions. This opinion is based on the following factors:

- The site was historically (since late 1800's) and continues to be used for commercial and manufacturing purposes. No industrial use of the site has been documented that would potentially impact soil or groundwater conditions at the site.
- Based on the Sanborn Maps and the City Directory information reviewed, the use of the property is consistent between the 5 year data gaps. Therefore, operations on the site between these data gaps will not detrimentally affect the identification potential RECs.
- Langan limited the database review to sites within 1/8-mile from the subject property. It is the environmental professional's opinion that based on the dense development of the site area, and former, current and proposed use of the site that the review of the database pertaining to this more limited area (1/8-mile) is appropriate and will not detrimentally affect the identification of potential recognized environmental conditions.

12.0 FINDINGS/OPINIONS

Based on information obtained during the visual inspection of the subject property, review of environmental databases and historic information, and contact with federal/state/local official agencies, the following historic recognized environmental conditions (HRECs), recognized environmental conditions (RECs), de minimus conditions and business environmental risks that may impact proposed redevelopment of the site were identified:

1. Potential impacts from historic printing, lithographic, and manufacturing operations;
2. Potential impacts from current and historical operations conducted at adjacent and nearby properties.
3. Potential impacts from onsite gasoline UST;
4. Potential impacts from onsite fuel oil AST; and,
5. Potential presence of historic urban fill.

It is the opinion of the environmental professional that historic operations at the subject property and adjacent and surrounding properties may have impacted the subsurface therefore, Findings 1 and 2 represent RECs. It is the opinion of the environmental professional that Findings 3, 4, and 5 may have impacted soil and groundwater on the subject property however as these impacts are common to densely developed urban areas and may only affect site redevelopment activities; these are not considered RECs.

13.0 CONCLUSIONS

Based on information obtained during the visual inspection of the subject property, review of environmental databases and historic information, and contact with federal/state/local official agencies, the following that may impact proposed redevelopment of the site were identified. Langan has performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice E1527-05 of a ±69-acre site located at 525 West 52nd Street, Manhattan, New York County, New York, the subject property. Any exceptions to, or deletions from, this practice are described in Section 11.0 of this report. This assessment has revealed no evidence of recognized environmental conditions (RECs) and business environmental risks in connection with the property except for the following.

Recognized Environmental Conditions

It is the opinion of the environmental profession that the following represent RECs:

Historic Use of the Subject Property

The subject property is identified on USEPA RCRA databases as a generator of non-listed ignitable hazardous waste based on forms received by the USEPA in 1996, 1999, 2001, 2002 and 2004 to 2008. The site has been identified for the disposal of non-listed ignitable hazardous waste in 2009 and the disposal of non-listed ignitable hazardous waste, non-listed corrosive hazardous waste, and silver-impacted hazardous waste between 1996 and 2000. Additionally, historic operations at the subject property as identified by the City Directory include lithography, printing, and a photography laboratory from 1920 through 1998. The Sanborn Fire Insurance Maps show printer operations at the subject property from 1951 through 1985 followed by envelope manufacturing from 1987 through 2005. Due to the potential that chemicals associated with the printing, lithographic, and other previous manufacturing operations may have impacted subsurface soil and groundwater conditions at the site, the historic use of the subject property is considered an REC.

Surrounding Sites

Potential impacts from current and historical operations conducted at adjacent and nearby properties involving the generation of hazardous waste, the use of ASTs, USTs and spills represent a REC due to the potential for off-site contamination migration to impact sub-slab soil and/or groundwater below the subject site. Five spills located within 1/8-mile of the subject property remain open.

- Mobil Oil #17-JWN is identified in the NY LTANKS database under NYSDEC Spill No. 8904939 (approximately ten spills have been consolidated under this number). The original spill was reported in 1989 due to a tightness test failure. Other spills consolidated under this spill number include a 20-gallon gasoline spill due to a tank overfill, the observation of contaminated soil and groundwater during UST removals, tank test failures, and the detection of VOCs at adjacent sites. The most recent spill consolidated into Spill No. 8904939 was reported in 2010 when 70,000 ppb of BTEX was detected in groundwater along the western boundary of the site during a Phase II Environmental Investigation. Dual-phase extraction wells were installed at the site in December 2012 for continued remediation of the spill. No further information was provided in the EDR report

regarding current groundwater conditions at the site or the effectiveness of the remediation.

- Mobil Service Station HPD is identified in the NY Spills database under NYSDEC Spill No. 9308101. The release occurred in 1993, when petroleum was found seeping through three surrounding cellar walls adjacent to the gasoline station. Subsequent investigation activities identified an off-site groundwater contamination plume associated with the spill. No further information was provided regarding the cleanup of the spill or the extents of the off-site plume in the EDR report. As of October 2012, the groundwater analytical data revealed exceedances of the groundwater quality criteria in two of the wells used to monitor the offsite plume.

- CBS Broadcasting is identified in the NY Spills database under NYSDEC Spill No. 0403162. The spill occurred when 6,000-gallons of oil was mistakenly delivered to a 1,000-gallon tank. A series of investigations and remedial actions including fluid and vapor extraction systems and quarterly groundwater monitoring were completed following the spill. The most recent round of groundwater monitoring documented in the NYSDEC narrative was completed in April 2012 and documented the presence of 0.05-feet of free product present in one of the monitoring wells and analytical results revealed the presence of low level dissolved VOCs.

- Commercial Building is identified in the NY LTANKS database under NYSDEC Spill No. 11000355. The spill was reported as the result of a tank test failure of a fuel oil storage tank. It was determined that the failure occurred as the result of a dry leak from an old weld on top of the tank. Repairs were attempted but failed and it was concluded that the tank should be taken out of service and removed.

- West 54th Street & 11th Avenue is identified in the NY Spills database under NYSDEC Spill No. 8905000. The spill occurred as the result of equipment failure and oil was observed to be entering the sewer. A Site Investigation Work Plan was reviewed by the NYSDEC in July 2012.

Several open NYSDEC spills have been identified within 1/8th-mile of the subject property that according to the information provided in the EDR report have documented off-site groundwater impacts that could affect the saturated soil and groundwater conditions beneath the subject property. Therefore, the presence of off-site impacts to groundwater from the above referenced sites present the potential for adverse environmental impacts to the subject property soil and groundwater and is therefore considered a REC by the environmental professional.

Business Environmental Risks

It is the opinion of the environmental profession that the following represent business environmental risks:

Underground Gasoline Storage Tanks

A gasoline UST is identified on Sanborn Fire Insurance Maps at the southern end of the building from 1951 through 2005. A magnetic anomaly was identified at the southern end of the building during a limited subsurface investigation completed at the subject property in 2010. Subsurface investigations completed in the area of the UST revealed no volatile organic compounds (VOCs) above applicable criteria in soil or groundwater; therefore, the UST is identified as a BER. Preparation and implementation of a contingency plan to address the presence of any USTs that may be encountered during excavation activities associated with future site redevelopment or renovation would adequately address this issue.

Aboveground Fuel Oil Storage Tanks

The subject property is identified in the NY AST and NY HIST AST databases for the presence of a 7,500-gallon AST containing fuel oil. This AST was observed during our site inspection in a cinderblock vault. The vault was observed via the vault access panel; however, vault access constraints prevented the inspection of the entire AST vault area. Based on the access limitations of this area and the potential presence of unobserved leaking in other portions of the AST area, the AST is considered a business environmental risk. Removal of the AST and any impacted underlying concrete or soil will be required during any proposed renovation or demolition of this building area. The presence of the AST represents a business environmental risk.

Historic Urban Fill

Laboratory analytical results of the shallow subsurface fill material collected during previous environmental investigations at the site identified impacts from poly-aromatic hydrocarbons (PAHs) and metals. Based on the analytical results and the classification of the soil it is anticipated that the material between the base of the existing basement slab and bedrock will be characterized as non-hazardous impacted fill material. The presence of impacted fill will require implementation of soil handling and management procedures during site redevelopment to address excavation, re-use, handling, and possible offsite disposal of this material.

Additional Non- ASTM Issues

Asbestos

A limited asbestos survey was completed in 2010. While none of the samples submitted for laboratory analysis confirmed the presence of ACM, the report concluded that pipe-insulation and associated mudded joints and roofing materials that were not sampled during the survey are assumed ACM. A complete asbestos survey of all building areas that will be renovated or demolished will be required prior to initiation of this work.

Lead-Based Paint (LBP)

A limited LBP assessment was completed in 2010. The results of the field screening revealed that LBP was found in the buildings in components such as walls, doors, door cases, pipe riser and columns, and laboratory analytical results further confirmed the presence of LBP. Proper handling and disposal of LBP will be required if this material is disturbed during proposed renovation/demolition of the onsite building.

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.

Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1920 through 2012. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 100 feet of the target property.

A summary of the information obtained is provided in the text of this report.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

Federal RCRA generators list

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 02/12/2013 has revealed that there are 6 RCRA-LQG sites within approximately 0.25 miles of the target property.

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 02/12/2013 has revealed that there are 59 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

A review of the EDR MGP list, as provided by EDR, has revealed that there are 5 EDR MGP sites within approximately 1 mile of the target property.

EDR US Hist Auto Stat: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR US Hist Auto Stat list, as provided by EDR, has revealed that there are 68 EDR US

EDR US Hist Cleaners: EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR US Hist Cleaners list, as provided by EDR, has revealed that there are 22 EDR US Hist Cleaners sites within approximately 0.25 miles of the target property.

Hazardous Waste Summary:
Waste code: D001

TANA SEYBERT (Continued) **1004761120**

Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

DEC Memo:	Prior to Sept, 2004 data translation this spill Lead_DEC Field was "O'CONNELL"CON EDE2 MIS REPORT25 gallons of trnsformer oil from transformer on 75 gallons of water in vault 3484 ... Possible entry into sewer due to existing water line on vault walls higher than fluid level now in structure. Not able to verify sewer connection as per conduit palte #29-D-2. A PCb sample was taken by W Ward... a release di not occur at this location due to mark on wall is an oily substance and considering it is a vault it will be assumed it has a pump and or drain at this time.DEC INSPECTOR NOTES1/4 /00, 2:05pm - left message for Albert Gordon, DEP spoke with Ray Lo, stain on vault wall approx. 2 feet above current fluid level. Acid to supervise, probable drain in vault. Opened sewer trap which goes to adjacent vault, some traces of oil sample taken, but will treat as SO-499 in meantime. Believe transformer has porous bottom .Update @4:00pm- Ray Lo left voice mail. Stanley Baldwin DEP just left site. Tanker truck enroute to drain transformer.
Remarks:	found what may be transformer oil on 75 gals water in vault -- no sign of transformer leak so far -- sample taken clean up pending results.

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

Summary Details:

Conditions at listing September 1983): The Hudson River PCBs Site is a 40-mile stretch of the Hudson River between Mechanicville and Fort Edward, New York. General Electric Co. discharged an estimated l.l million pounds of PCBs into this stretch of river. The State has identified 40 hot spots, defined as sediments contaminated with greater than 50 parts per million ppm) of PCBs. Also included in the site are five remnant areas, which are river sediments exposed when thelevel of the river was lowered due to removal of the Fort Edward Dam. The State has taken initial measures to stabili e the remnant areas from erosion. In September 1980, Congress passed an amendment to the Clean Water Act CWA) that included the Hudson River PCB Reclamation Demonstration Project. Under this legislation, the EPA Administrator could authori e a 75 percent grant, not to exceed 20 million. EPA issued a final Environmental Impact Statement in October 1982 evaluating various dredging alternatives for a demonstration project. EPA has prepared a feasibility study to evaluate alternative remedial actions under CERCLA. The Administrator has determined that CERCLA funds may be used for remedial action atthe remnant areas and for evaluating the effectiveness of the water supply system at Waterford, New York. Status June 1984): EPA has completed a draft feasibility study identifying alternatives for remedial action. A search for partiespotentially responsible for wastes associated with the site has been completed, and EPA has sent letters to two potentially responsible parties notifying them of possible legal action under CERCLA.

Site Description: The Hudson River PCBs Site includes a nearly 200 river-mile stretch of the Hudson River in eastern New York State from the Village of Hudson Falls to the Battery in New York City. The Hudson River has been designated an American Heritage River because of its important role in American history and culture. This federal Superfund Record of Decision (ROD) addresses the risks to people and ecological receptors associated with polychlorinated biphenyls (PCBs) in the in-place sediments of the Upper Hudson River. The Site is divided into the Upper Hudson River which is the length of river between Hudson Falls and the Federal Dam at Troy, New York and the Lower Hudson River which is the length of river between Federal Dam at Troy and the Battery. For purposes of this project, EPA further divided the Upper Hudson River area into three main sections known as River Section 1, River Section 2, and River Section 3. The Site also includes five Remnant Deposits, which are areas of PCB-contaminated sediment that became exposed after the river water level dropped following removal of the Fort Edward Dam in 1973. The Upper Hudson River portion of the Site extends from the Fenimore Bridge in Hudson Falls to the Federal Dam at Troy, a distance of just over 43 river miles. The Lower Hudson River extends from the Federal Dam to the southern tip of Manhattan at the Battery in New York City. The Mid-Hudson River, which is primarily a subset of the Lower Hudson River, extends from the Federal Dam at Troy to just south of Poughkeepsie. The predominant sources of PCB contamination to the Upper Hudson River were two capacitor manufacturing plants owned and operated by GE. The plants are located adjacent to or near the Hudson River in the Village of Hudson Falls and the Town of Fort Edward. Over a 30-year period, the plants discharged a substantial amount of PCBs into the river. At the GE Hudson Falls plant, leakage of non-aqueous phase PCB-bearing oils through bedrock to the river continues to be a source of PCB contamination. Regarding the former outfall to the Hudson River from the GE Fort Edward plant, New York State Department of Environmental Conservation (NYSDEC) issued a Record of Decision in January 2000 that calls for the excavation of PCB-contaminated soil and sediment in this area of the Upper Hudson River shoreline in order to eliminate this source of PCBs to the river. EPA’s analysis assumes a significantly reduced PCB loading to the river from these sources once the State’s plans for remediation are implemented. PCBs, the chemicals of concern addressed in this decision document, have been classified by EPA as probable human carcinogens. They are also linked to other serious non- cancer adverse health effects based on observations in animals and emerging evidence in humans. Once discharged from the GE plants, the PCBs adhered to river sediment and accumulated downstream as they settled in impounded pools and other depositional areas. Historic fish and sediment data indicated PCBs were accumulating downstream of the old Fort Edward Dam as well as accumulating behind the dam. The removal of the dam in 1973 resulted in a remobilization and downstream distribution of PCBs that had accumulated behind the dam. Historically, the highest PCB sediment concentrations have been detected in the cohesive sediments within the Upper Hudson River. River scouring/ erosion and other mechanisms have mobilized PCB- contaminated sediments from the extensive cohesive deposits, redepositing them farther downstream all the way to the Battery. The preponderance of data indicates that burial of contaminated sediment by cleaner materials is not universally or uniformly occurring. Data also indicate that contaminated sediments in River Sections 1, 2 and 3 continue to serve as the major source of PCBs to the water column and the fish within the Upper Hudson River. During an approximate 30-year period ending in 1977,

HUDSON RIVER PCBS (Continued) **1000384273**

PCBs were used in capacitor manufacturing operations Hudson Falls and Fort Edward, New York facilities. PCB oils were discharged both directly and indirectly from these plants into the Hudson River. This included both non-permitted and permitted discharges. Even after permits were received in 1975, permit exceedances occurred. Estimates of the total quantity of PCBs discharged directly from the two plants into the river from the 1940s to 1977 are as high as 1,330,000 pounds (about 605,000 kg). Many of the PCBs discharged to the river adhered to sediments and accumulated with the sediments as they settled in the impounded pool behind the Fort Edward Dam, as well as other depositional areas farther downstream. Because of its deteriorating condition, the Fort Edward Dam was removed in 1973. Five areas of PCB-contaminated sediments were exposed due to the lowering of the river water level when the Fort Edward Dam was removed. These five areas are known as the Remnant Deposits. During subsequent floods, PCB-contaminated sediments from the Fort Edward Dam area were scoured and transported downstream. EPA notified the company that had the two plants of the remedy selected in the 1984 ROD and offered the company the opportunity to implement the selected remedy with respect to the Remnant Deposits and the Waterford drinking water supply evaluation. The company declined EPA's offer. NYSDEC, with funding provided by EPA, conducted the evaluation at the Waterford Water Works. In addition, NYSDEC prepared a design for the in- place containment of the Remnant Deposits. This design was completed in 1988. In March 1989, the company offered to assume responsibility for the implementation of the in-place containment remedy for the Remnant Deposits. EPA issued a September 27, 1989 Administrative Order on Consent to the company which required the company to prepare a remedial design report for the construction of access roads to the Remnant Deposits and to submit a design for the in-place containment of the Remnant Deposits incorporating the NYSDEC-prepared design, plus any EPA-approved refinements to that design. EPA also issued a September 27, 1989 Administrative Order to the company requiring the company to construct and maintain the access roads to the Remnant Deposits. The company constructed the in-place containment of the Remnant Deposits under a 1990 Consent Decree with EPA. EPA will evaluate the need for further remedial action for the Remnant Deposits after completion of a 5-year review of the Remnant Deposit containment remedy, performed pursuant to CERCLA ?121(c). The company's manufacturing plants in Hudson Falls and Fort Edward are listed under the New York State Inactive Hazardous Waste Disposal Sites Remedial program. The company currently is conducting remedial activities near the Hudson Falls and Fort Edward plants pursuant to Orders on Consent with NYSDEC. The company has thus far declined to implement the January 2000 NYSDEC Record of Decision for the Fort Edward plant Outfall 004. The NYSDEC is conducting the remedial design for that ROD. As one of America's great rivers, the Hudson has played and will continue to play a major role in the history, culture, and economy of the area. The Hudson has been designated an American Heritage River because of its important role in American history and culture. Current and reasonably-anticipated future land use and surface water use are described below. Current land use includes a variety of residential, commercial and industrial activities. Use of the river and lands surrounding the river are projected to remain the same. At this time, no changes in future land use are known, nor are any new uses expected. The Site passes through 14 different counties as the river flows to its final discharge point in New York Harbor. Four counties (Albany, Washington, Rensselaer, and Saratoga) lie adjacent to the more highly contaminated portions (areas of proposed active remediation in River Sections 1, 2 and 3) of the Upper Hudson River between Troy (Federal Dam) and Hudson Falls. Within these four counties, forests and farmlands surround urban centers and historic villages. There are apple orchards and dairy farms, parks, nature preserves and gardens. In addition to the GE Hudson Falls and Fort Edward plants, the area is home to technology

companies, oil service companies and food companies. Saratoga and Washington Counties have experienced population growth between 1990 and 1999 of 10.2 percent and 1.4 percent, respectively, while Rensselaer and Albany Counties have experienced population declines of 1.9 percent and 0.3 percent, respectively. Total population of these four counties, according to July 1999 estimates by the US Department of Commerce Bureau of the Census, is just under 700,000. Warren County, in which the City of Glens Falls is located, has a population of just over 60,000 and is just to the northwest of the Hudson River PCBs Site. A Record of Decision (ROD) addressing operable unit 1 (OU 01) was completed in September 1984. A Record of Decision addressing OU 2 was completed in February 2002.

Environmental Interest/Information System
CERCLIS (Comprehensive Environmental Response, Compensation, and Liability Information System) is the Superfund database that is used to support management in all phases of the Superfund program. The system contains information on all aspects of hazardous waste sites, including an inventory of sites, planned and actual site activities, and financial information.

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit

Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

DEC Memo:	"Modified" TTF letter e-mailed to HPD property manager -Derek Parsons.Director, Environmental Compliance NYC HPD - Office of Development100 Gold St, Rm 9V-5, NY, NY 10038(p) 212-863-7172; (f) 212-863-7988, (C) 917-559-4337parsonsd@hpd.nyc.gov e-mail message sent:Attn: Derrick Parsons, HPD Property ManagerThe following spill cases refer to two Tank Test Failures that both occurred on April 11, 2011.Spill #1100355 - 500 West 52nd St, Manhattan Spill #1100365 - 400 Grand St, ManhattanBelow is the standard text sent out to all property owners/managers after a tank test failure:On April 11, 2011 the New York State Department of Environmental Conservation (the Department) received notification of a tank system integrity failure at the above mentioned facility. You have been identified as either the owner of this tank or the owner's representative. Because the tank system was found not to be tight, a petroleum release may have occurred at this property, which is a violation of the New York State Environmental Conservation and Navigation Laws. Therefore, the Department requires that you take immediate action to prevent and stop any additional release of petroleum, determine the cause of the failure, and investigate/remediate any soil and/or groundwater contamination, if a petroleum release has occurred. The following

COMMERCIAL BUILDING (Continued) **S111012249**

steps are required by the Department: 1. Determine if the "wet" portion of the tank system failed. If so or if it is inconclusive as to which part of the system failed, then the tank's contents must be emptied immediately to ensure that no further release occurs.2. Determine the cause of the tank system integrity failure. This process may include, but is not limited to, excavation of a part of the tank system, isolation of the tank from the piping and separate retesting, or tank and/or piping repair/replacement with subsequent system retesting.3. Remove any contaminated soil found during the excavation of the tank or piping to the extent feasible and properly disposed of it under applicable regulations for petroleum contaminated soil. 4. Submit a letter or report to this office no later than one month from the date of this letter. The report must be prepared by a qualified professional. The report must reference the spill case number and the site address. The report must specify the cause of the tank system failure and the actions taken to stop, minimize, or remove the petroleum release and must also include conclusions and recommendations for further action. Specific mention must be made if any contamination was found, and how it was dealt with.**********
**********Mr. Parsons - As per our telephone conversation, it sounds as though your office is proceeding with the required isolation and retesting necessary to determine the location of the leaking problem. In terms of the NYSDEC, we are most concerned with the identification of any actual spill or soil contamination which may have resulted from a leak.Please get back in touch with our office as soon as this additional investigation is completed with any results you may be able to provide.Thank you,Steven SangeslandEnvironmental EngineerNYSDEC - Region 2 Spills Unit**********
**********5/12/2011
Sangesland spoke to Derrick Parsons at HPD. He had the environmental consultant in his office. He said the issue with 500 W 52nd St site was a dry leak from an old weld on the top of the tank. They tried to repair it, but it didn't work. (AST wrapped) Tank is being taken out of service and removed. Sangesland asked for a color photo of the tank area AFTER the tank was removed. If there is oil staining, a boring will be required.

Remarks: 1247 THE CALLER ADVISED DISPATCH THE SPILL AMOUNT IS UNKNOWN AT THIS TIME. THE TANK TEST REFLECTED A FAILURE IN THE SYSTEM. THE CLEAN UP IS PENDING UPON TANK REMOVAL. THE TANK IS ABOVE GROUND.

DEC Memo:	3/13/09 - Raphael Ketani. The site is a 6 story apartment building that was turned into condominiums. The block and lot are 1080 and 25. The main address is listed in Property Shark as 753 10th Avenue. The alternate addresses are 755-765 10th Avenue, 507-515 West 51st Street, and 510-518 West 52nd Street. The owner, according to ACRIS, is Clinton Green South, LLC, c/o The Dermot Company, Inc., 320 West 57th Street, NY, 10019.According to Donna Vieni of ABC Tank (718) 272-2800, they were contracted by Lemi Construction (Sal is the contact; (646) 721-0019) back on 8/1/08 to remove a 275 gal. tank and the associated contaminated soil. She said that the soil and tank were removed and end point samples were taken. She has the results and they were at or below TAGM. She said that she has the whole remediation report and she will send it to DEC. I asked her why the spill wasn't reported until now. She said that she had no answer.3/17/09 - Raphael Ketani. Donna of ABC Tank sent me the FAXed soil analyticals for the site. I reviewed them and found the residual contamination to be non-detect for VOCs and generally well below the TAGM limits for SVOCs.As the analytical results indicate that the residual contaminant concentrations are very low and Donna told me that the tank and the contaminated soil were removed, I am closing the spill case.
Remarks:	Caller states soil sample results showed impacted soils.

DEC Memo:	Prior to Sept, 2004 data translation this spill Lead_DEC Field was "ZHITOMIRSKY"10/10/95: This is additional information about material spilled from the translation of the old spill file: GASOLINE - WATER. Refer also to 98-03781 (783 Tenth Ave).TRANSFERED FROM TIBBE TO ZHITOMIRSKY ON 4/14/2003.PROJECT NOW BEING HANDLED UNDER NYC DDC CONSENT ORDER.04/27/04: This site is related to a former Mobil station and it is transferred to NYCDDC. - Alexander Zhitomirsky. This spill is related to adjacent AT&T building spill at lot # 811 on 10th Ave. according to AZ. -II (02/18/05)06/10/2005 Koon Tang received a letter dated June 8, 2005, from DDC stating that DDC/LiRo performed site investigation and proposed a remedial plan to NYSDEC in November 2001. The proposal was to perfrom ORC and monthly Vac-Truck recovery. The plan was approved by NYSDEC in 2002. DDC performed monthly Vac Truck product recovery through Noember of 2003. The site is currently under the jurisdiction of HPD, who is working closely witht heir developer (The Dermot Company/Archstone Smith Operation Trust) to continue the future excavation/construction/environmental cleanup of the site. NYCDDC is not continuing with the environmental cleanup of this site. The letter does not contain HPD contact information. I have discussed this site with Koon Tang and called Fatemah Ashkan (NYCDDC) and left a message for her requesting information regarding new contact's phone number, address and their plans for the site further remediation. AZ06/24/2005 I left a message for Carol Steinberg (HPD) 212-863-8362 regarding further site remediation. AZ6/27/2005 Conversation with Carol Steinberg (Attorney for HPD). HPD is selling the site. The new owner will remediate the site not HPD. Ms. Steinberg will get back to me with the additional info regarding the developer. AZ7/14/2005 Carol Steiberg (HPD) conveyed info regarding the new owner: Dermot Clinton LLC c/o 320 West 57th Street, NY, NY 10019. She will get back to me with a phone number and name.AZ11/14/2005 Conversation with Carol Steinberg (HPD). She promised to get back to me with a phone number for the new RP. attorney is Linda Shaw (585)-546-8430). He asked me to call his attorney. I called L. Shaw. Conversation with Ms. Shaw. The site entered BCP program. Dale Desnoyers signed the agreement on 2/10/2005. DEC PM is John Durnin. Remdial Action Plan was submitted and approved. Remediation started around September 2005. Excavation has been completed. Post excavation samples were taken in the last few weeks. Consultants are Langan Engineering and Environmental Services. PM is Tarek Khouri 212-479-5450. AZ11/21/2005 Conversation with John Durnin (DEC Albany 518-402-9774). They have not excavated on the former Mobile Station yet. They will excavate the site to the bedrock within six months and take end point samples. They are going to build two 24-story residential towers on this site. Dermot Clinton is not responsible as per BCP agreement for the off site clean up. AZ4/4/2006 John Durnin (DEC Albany (518-402-9774). All the remedial work has been done on site. Contaminated soil was excavated to the bedrock. Approved backfill must be brought to the site. Remedial report will be submiteed in a month. As for off site investigation the case will be brought up to the enforcement division in Albany. AZ6/13/2006 Left a message for John Durnin - DEC Albany (518-402-9774). AZ6/16/2006 A memorandum is being drafted to the Division of Environmental Enforcement (DEE) requesting them to contact the Responsible Party (City of New York) regarding the documented off- site plume from this Former ExxonMobil Service Station. The BCP Program requires that NYSDEC pursue the Responsible Party to address and remediate the off-site contamination. AZ9/14/2006 An e-mail was sent from John Durnin (DEC Albany) to Maureen Schuk. The e-mail contained summary/update for this site. According to the e-mail, all the soil on the entire site was excavated to bedrock and disposed off-site in 2006. John Durnin stated that the off-site plume was not remediated by Dermot Clinton Green since they are not responsible for off-site contamination in the BCP program. As per the BCP Program, the NYSDEC is required to contact the responsible party (NYCHPD) to remediate the off-site contamination or do it through the State Superfund Program. New York City Housing, Preservation and Development is still the responsible party for open Spill No. 9308101 which now consists only of off-site petroleum contamination. John Durnin, as the NYSDEC Project Manager for this BCP Project, will send a memorandum referring this BCP site to the NYSDEC Project Attorney. The Attorney then contacts NYCHPD to get them to complete the off-site clean-up. John Durnin is drafting the memorandum right now. AZ12/19/2006 John Durnin (DEC Albany). This BCP site is done. A certificate of completion has been issued. The Health Department has been notified. John Durnin is preparing a memo for DEE (Dept. of Environmental Enforcement - Debbra Christian) requesting enforcement actions against the City of New York (HPD). The City of New York is responsible for the offsite clean up. AZ1/10/2007 An Enforcement Action Memorandum by John Durnin was sent to Deb Christian (Superfund and Brownfield Restoration Section DEE) regarding site on 1-4-2007. The memorandum was forwarded to DER program Attorney, Rosalie Rusinko. Rosalie has inquired about the HPD contact. I forwarded to John Durnin HPD contact information. All nine off-site wells have been filled with concrete. AZ11/5/2007 The City accepted the responsibility for the off-site investigation. They hired URS to follow-up with the off-site investigation. They will be soon setting up a teleconference with John Durnin and URS. Harvey Roberts is in charge of this project. J. Durnin observed that sidewalk in front of the ATT building was completely excavated to the

bedrock and they were poring concrete in the excavation. They will send me a copy of the report when it is completed. AZ 12-11-2008 A STIP Agreement and CAP for the off-site investigation was signed on 12/11/2008 via John Durnin (Central Office). 3-1-2010 Contacted John Durnin. The investigation has been done and they submitted the Investigation Report in July 2009. The field investigation has been approved. Consultants submitted Remedial Action Plan in August 2009 and it was approved by DEC in September 2009. Consultants proposed to install ORC socks in several wells. Two wells out of seven had BTEX. In mid October they installed ORC socks. The socks will stay for 6 months. Quarterly reports will be produced. I asked John D. to forward e-copies to me. He will do it or upload them to e-docs. AZ1-31-2012 At the meeting with URS and DDC on Jan. 31, 2012, URS stated that latest groundwater data shows two wells with total VOC of 49 ppb and 165 ppb. URS recommended removing the ORC socks to determine if concentrations remain low enough to petition for closure of the spill number. AZ1-7-2013 At the meeting with DDC and URS on Jan. 3, 2013, URS stated that the ORC socks were removed on March 2, 2012, and all wells were sampled in early April 2012. Two wells contained parameters at concentrations above groundwater quality criteria (169 ppb and 361 ppb). New ORC socks were installed in the wells. The October 2012 sampling data indicates that two of the four wells contained parameters at concentrations above the groundwater quality criteria. AZ

DEC Memo:	Prior to Sept, 2004 data translation this spill Lead_DEC Field was "KRIMGOLD"6/22/04. J.Krimgold at site. According to delivery slip actual amount spilled ~6000 gal. Oil delivery Co. Metro Fuel Group delivered oil to wrong (1000 gal) tank instead of to 15,000-gal tank system. Oil released through top of tank, spilled in basement on concrete floor. Some oil went to drains in floor. Action Envt'l (contact Tod @973-896-6185) performing clean up.Ambient Group (Mike Borello cell # 917-376-4179) was hired by CBS as envt'l consuling firm.6/29/04. J.Krimgold met at site with Paul Puccio (CBS), Mike Borello (Ambient), and Tod (Active Env.). Inspected buildings' basements adjacent to 857 10th Ave and also owned by CBS. Found oil seepages into buildings ~50 and 100 ft respectively from place where release occurred. Oil and water accumulation in pits installed by contractor in basements floor. 12/22/05: This spill transferred from J. Krimgold to S. Kraszewski. Reviewed Remedial Action Monitoring Plan prepared by Ambient Group, Inc. dated 6/23/05. Report is conglomeration of remedial work performed at site from day spill occurred to above-mentioned date. Based on data, conclusions and recommendations are proposed for AOCs (Areas of Concern.) AOC #1: Basement of CBS building where spill occured. 3 feet of contaminated soil were removed immediately after spill for majority of basement floor; approx 200 tons soil removed. 22 soil borings were advanced in basement to delineate and monitor plume. Free product and GW measurements were taken to determine thickness of product and GW levels. Also, 3 monitoring wells were installed around building exterior to monitor possible free product migration. Borings in basement were converted to total Fluid Recovery wells and would eventually work in tandem with an enhanced fluid recovery system. Initial recovery system involved extracing GW + product from borings to an oil/water separator. Soon after this system was functional, an SVE system was installed to remediate soil. Both systems have been operational since late 2004. Data in report is given as Total Recovery Trend for both systems combined. Data start from Sept 2004 and end in Feb 2005. Overall trend is a decline in product recovery from contaminated wells. Only a handful of 22 wells are still recovering product or vapors, and even fewer recover significant amounts. Proposed action is quarterly monitoring.AOC #2: Adjacent building sub-basement had free product/water seeping through wall at approx 600 gallons/day. Series of wall drains connected to GW pump collect GW for treatment. Borings and MWs not possible in this location. Summary of system will be provided in separate rpt. AOC #3: Free product migration into sub-basement of nearby building (not

CBS BROADCASTING (Continued) **S104278942**

adjacent to original spill area.) Free product is migrating through preferential pathways between buildings. Walls are rubble-masonry foundations with a history of GW infiltration. 5 MWs have been installed and quarterly monitoring is recommended.Need: report for Recovery System at AOC #2, monitoring updates for AOCs #1 and #3 - SK12/22/05: Called Michael Borello at Ambient Group. He no longer works for them. I was transfered to Gloria, she would find out info about site and have someone contact me. - SK12/22/05: John Mascioli from Ambient Group called regarding spill. I requested any recent documents and monitoring reports he had. Also, Remedial Action Monitoring Plan from June 2005 is missing two figures dealing with MWs at AOC #3. He said they've been monitoring monthly since May for AOCs #1, #2 and #3. They are renewing permit for AOC #2 oil/water separator next week and he will send me document along with missing figures and recent monitoring report. John mentioned that monitoring data for AOC #1 is inconclusive for many wells. - SK01/09/06: Called John Mascioli at Ambient Group, asking about site update report supposedly due last week. John said he is waiting for lab to send him some final results before he can send out report. He expects it to be complete this week. - SK01/30/06: Joseph Holtzberg from Ambient called (917-861-7238) to inform me about site. He wanted to know what information I need to simplify scenario. I said I was still waiting for recovery system update and monitoring data I talked to Jon Mascioli about. They're almost finished with report and will send it very soon, he said. Also, he would like to have a meeting after I have reviewed report to hammer out a time frame for site activity. I told Joseph I would contact him after I had looked over report. - SK02/02/06: Received documents from Ambient Group. Reviewed Volatile BTEX Air Sampling Results for two SVE systems at 857 10th Ave. Influent and effluent samples since Sept are clean. It appears SVE systems have performed well for extracting petroleum. However, regarding liquid extraction for these wells, no data exists from Feb. 2005 to present. Must have MW and liquid phase extraction data for this system. Received document with latest oil/water separator effluent results for 513 West 56th St., adjacent to CBS basement. Three separate effluent removals show consistent amounts of oil and water, roughly 1/3 of liquid is oil, rest is water and silt. Attached is request for one-year extension of discharge permit. Permit is issued by DEP; DEC does not regulate discharge into sewer. Since amount of oil recovered is constant this seems like plausible request. Continue operation of system until discharge slows or oil is no longer present in effluent. Currently, no seepage is occuring for 518 West 56th St., 3rd area of concern determined in June 2005 Site Investigation Rpt. After in-wall drain tap collector at 513 was installed, seepage through 518 basically ceased. It seems that collector is taking care of both sites. I spoke with Joseph after reviewing documents. I asked for MW measurements and records for liquid phase extraction data. He said information will be sent out as soon as he can arrange it. - SK02/22/06: Reviewed Jan. 2006 Quarterly GW Monitoring Rpt submitted by Ambient Group. Static water level measurements were performed for 5 MWs, both on- and off-site. Also, static level measurements were taken in 24 soil vapor extraction wells. Results are as follows:1) Only MW-5 in CBS courtyard exhibited free product, 0.25" in depth. GW samples taken from each well revealed dissolved contamination exceeding GW standards for VOCs and SVOCs including BTEX and MTBE for MW-5 only. 2)Five of 24 recovery wells in CBS basement exhibited free product from 1 to 8 inches

CBS BROADCASTING (Continued) **S104278942**

thick. 3)Approx. 2 feet of silt is present in each recovery well, reducing efficiency significantly. Ambient recommends:a)Continued quarterly monitoring of 5 MWs.b)Removal of silt accumulations in recovery wells, purging of wells and then additional static water level measurements.c)Increase frequency of free product removal from recovery wells.d)Continued operation of wall drain tap and oil/water separator in adjacent building.e)Evaluate capacity loss from 24 vapor extraction wells.f)Perform a survey of GW flow to determine its direction.Site plan does not show locations of 5 MWs, only a CBS basement diagram is provided showing extraction wells. Also, report uses terms "extraction well" and "recovery well" synonymously. Ambient must clarify these issues. - SK02/23/06: S. Kraszewski spoke with John Mascioli from Ambient Group. CBS contact info: Alan Krupski CBS Braodcast Center 527 West 57th Street New York, NY 10019We clarified information regarding fluid extraction system and SVE system. Apparently, it's a dual-phase recovery system where a drop tube inside PVC recovers total fluids which are then pumped into an oil/water separator for collection and removal. Each of 22 SVE recovery wells contains a drop tube for fluid recovery. Also, in latest rpt it was observed that MW-5 contained product where it previously had none. Since updated site plan was not available with MW locations, it was possible that contamination was spreading. However, MW-5 is located next to adjacent basement where a wall drain tap is installed and already collecting fuel oil. Since contamination is known to be there, no cause for alarm is necessary. - SK 02/27/06: Two letters sent out, one addressing SVE systems and requesting addt'l air sampling & analysis of all petroleum-related VOCs, not just BTEX. This rpt is due by March 30. Other letter approves Ambient's recommendations for continued operation of fluid extraction system. They also will perform required maintenance on extraction wells and keep wall drain taps with oil/water separator in service. GW flow direction will be recalculated. Comprehensive site plan that includes all wells with 2 basement systems was requested in next quarterly rpt. - SK04/05/06: Spoke with Joe Holtzberg and John Mascioli. Within a week or two, more well readings and air sampling from two systems. By mid-April sampling and gauging work will be underway. Also, Joe and John stressed their client's concerns about how long this work could last because this persistent contamination may be migrating from off-site. I said it will be easier to make a determination after these results arrive at my desk, and the faster I receive them the faster they will have an answer. - SK 06/22/06: Received email from Sean Wallace at Ambient Group, new project manager for site. Email included influent and effluent air sample results from SVE system. Results are clean for both influent and effluent. I called Sean and asked if I could receive entire report, not just pieces. He will mail me a copy of report and fax me rest of results, i.e. GW analyticals, gauging and product thicknesses. GW results show some elevated SVOCs and VOCs in MW-5 as well as 0.4 feet of product. Several other wells exhibit 0.1 to 0.2 feet of free product. MW-5 is located next to adjacent building where a passive recovery system consisting of wall taps to drain oil is already installed. - SK06/26/06: Received & reviewed April 2006 Quarterly GW Monitoring Rpt from Ambient Group. Influent and effluent air sampling results from both SVE systems found no VOCs above detection limits. Since no VOCs were detected from extraction wells, system may have removed all it is capable of removing. 5 recovery wells exhibited 0.1 to 0.2 feet of remaining free product. MW-5 had 0.4 feet of free

CBS BROADCASTING (Continued) **S104278942**

product, but is next to wall drain tap, which is currently recovering product. Also, MW-5 detected MTBE, not found in diesel, slightly above TOGS standards. Samples from MWs 1 to 4 had no VOCs or SVOCs detected. MWs 1 to 3 are located outside along building perimeter. Ambient recommends continued monitoring and sampling of all wells and SVE emissions, free product removal and pulsing of multiphase system. - SK06/30/06: Spoke with Sean Wallace regarding report. I asked that they always include a site plan displaying entire site, with neighboring streets and other adjacent buildings, plus all MWs, borings and recovery systems. I asked about drain tap system in adjacent basement, and Sean said it is recovering less and less. I asked for manifests of recovered fluids and he said he would get them to me quickly. Also, I told Sean that since SVE system is not recovering any volatiles next course of action would be to shut it down rather than running it and monitoring. I discussed conversation and report with J. Kolleeny. He recommended asking Sean to shut down parts of system that are no longer recovering free product. I sent Sean an Email approval for recommendations in report. - SK08/07/06: SK met on-site with Sean Wallace from Ambient group (212-944-4615) and with Alan Krupski from CBS. Having never been on-site before, I wanted to inspect SVE systems and wall drain-tap system. Effluent from both SVE systems reveals no VOC consituents in air. Ambient is proposing to shut down only one system, SVE2. Ambient will pulse system to see if conditions change at equilibrium. This system runs vertically in each well located in basement. SVE1 will remain on for now in case any odors may appear. Several wells exhibit free product of an inch or less, so they will continue to recover from them. Wall drain tap is still recovering an oil/water mixture because it seems that bedrock forms a depression along basement wall where oil has settled. Only about 10% of mixture is actually oil. I requested that Ambient submit a recommendation for futher action regarding operation of systems, especially SVE2. Report is due by end of August. - SK08/31/06: Received July 2006 Quarterly GW Monitoring Report from Ambient Group. Influent and effluent samples from SVE2 show no VOCs or SVOCs detected. GW samples from perimeter MWs reveal no SVOCs or VOCs above TOGS levels. Several recovery wells still exhibit several inches of free product. Ambient recommends continued removal of free product, use of wall drain tap system and O&M of horizontal system SVE1. SVE2 will undergo a pulse test in conjunction with monitoring of all wells to see if system may have an impact on GW; monitoring and sampling of MWs may continue based on results of pulse test. SK sent out approval letter for all recommendations. - SK12/01/2006 - Sean Wallace (Ambient Group) called, asked that project be reassigned due to SK's departure from DEC. They believe remedy is done and are looking to turn system off. I (Vadim Brevdo) suggested they prepare & submit final remediation rpt, which should be consistent with DER-10, and we will review and decide whether remedy is completed or must go on. I committed to discussing this with my staff and having project re-assgined to other P.M.12/05/06: This spill case transferred from S. Kraszewski to J. Kolleeny. Spoke with Sean Wallace of Ambient Group. He said pulsing of SVE system has not increased recovery; also, several wells still have a little free product (0.01-0.02 ft.) that does not seem to be going away, they may consider other options including bioremediation. They are not asking for spill closure yet, but will submit rpt presenting current site status and asking for permanent shutdown of SVE system. - J. Kolleeny12/14/06: Received email from Sean Wallace (Ambient Grp.) with attached rpt summarizing

CBS BROADCASTING (Continued) **S104278942**

pulse test of SVE2 system (in eDocs, rpt has no title page, no Fig. 1). Email stated: "Here is latest rpt for project, concerning pulse test of SVE 2 system, which we call horizontal system. 22 basement wells are hooked up to SVE system. At start of project, most wells had some free product (8/2004). By 8/2006 only 3 wells (deepest wells) had any product, and after we pumped those out, levels never came back above 0.02 ft. This is when we did shutdown monitoring. Sep-Oct 2006. I'm still collating all previous quarterly rpts along with intial rpts on remediation. Jan 2007 is next scheduled Quarterly; we'd like to make it last one. We will be collecting GW samples, air samples from SVE1 (vapor control system - vertical piping system under new concrete floor) and water & free product levels to demonstrate current conditions are not health concern. We are suggesting that at this point, to attack remaining fuel, bioremediation will be most effective, if further action is called for." - J. Kolleeny12/28/07: Received email from Sean Wallace of Ambient Grp. stating: "We are planning shutdown test of vapor control system at 857 10th Ave (CBS Spill # 04-03162). Purpose is to determine if there will be detectable odor or measuarable VOCs in basement area or upper floors if this system is not operating. Plan is to monitor over a weekend. Thus, system would be off for 2-3 days. Would DEC require test to cover longer period of time? This is our main question at this point. As discussed previously, there is no more free product in observation wells. System in place now is installed under new concrete floor poured after excavation of top few feet of contaminated soil. There is gravel bed laying over plastic membrane. Horizontal piping leads to carbon bed filter. Inlet and outlet sampling of this system has come back non-detect since April 2006." I sent email reply: "It would be preferable to wait 5 to 7 days to see if odor problems or detectable levels of VOCs develop in building. Please let me know if this is acceptable. Also, is there any residual dissolved-phase GW contamination at site, since free product seems to have been taken care of? (Is GW sampling being performed on regular basis?)" Sean sent reply: "We will take your suggestion to CBS. They definitely want to do things in most acceptable manner, so we will plan for week-long monitoring event. Last GW sample was taken during July '06 Quarterly Monitoring. Method 8270 showed Acenaphthene and Fluorene at 2.5 ug/L and phenanthrene at 0.96 ug/L (D.L. 5.2 ug/L) in only one of monitoring wells in interior courtyard. Method 8260 showed MTBE at 5 ug/L (not additive in fuel #2) and n-butylbenzene and tert-butylbenzene around 2.5 ug/L (D.L. 1.0 ug/L). Perimeter wells were non-detect. We will take samples again for January event." - J. Kolleeny03/20/07: Reviewed January 2007 Quarterly Monitoring Report (in eDocs). Report shows no contam in monitoring wells MW-1 through MW-5 (perimeter & courtyard wells), but low levels of dissolved VOCs (highest are MTBE at 139 ppb and naphthalene at 51 ppb) in several basement wells located near 3 basement wells that still have small amounts of product (from 0.02 ft. to 0.1 ft.); also VOCs in oil/water separator influent, including 169 ppb naphthalene, 122 ppb 1,2,4-trimethylbenzene, and 47 ppb total xylenes, but effluent to sewer is within limits. Influent and effluent air samples for vapor control system SVE1 all ND. Report recommends pulsing SVE1 system to determine if vapor control is still necessary, reducing GW monitoring frequency from quarterly to semi-annual, and continuing to operate perimeter wall drain tap and oil/water separator system until inlet concentrations of target compounds allow direct discharge to sewer. I sent email approving

these recommendations to Sean Wallace of Ambient Group on 3/20/07, with cc to Allan Krupski of CBS (212-975-2689, awkrupski@cbs.com), asking that basement wells be monitored in addition to perimeter/courtyard wells. Also asked that SVE1 pulse test include indoor air sampling for specific hydrocarbon compounds, that system influent sample be collected when system is re-started, and that scope of work for indoor air sampling be submitted to DEC when available. Changed spill status from P3 to P2. - J. Kolleeny04/24/07: Received email from Sean Wallace of Ambient Group on 4/19/07, with attached proposed protocol for shutdown test of SVE-1 system with concurrent indoor air monitoring for VOCs (in eDocs), to be performed week of 4/23-27/07. Sent Sean an email asking if this document was for me to review/approve before they do the test; he sent reply stating it was sent to me for information purposes only and that it addressed all concerns I expressed in our phone conversation several weeks ago. - J. Kolleeny07/09/07: Received June 2007 SVE1 Shutdown Test Results rpt by Ambient Group on 6/14/07 (in eDocs). Rpt presents results of indoor air monitoring for total VOCs during 10 days system was shut down, and results of vapor influent grab sample from when system was re-started. According to Ambient, TVOCs detected in indoor air were not above naturally varying background levels. Rpt lacks conclusions & recommendations sections. Spoke with Sean Wallace of Ambient on 7/9/07 and pointed out lack of Conclusions and Recs, and asked for clearer presentation of indoor air results. He said he would revise rpt and re-send. He also said no odors were detected in work spaces of bldg while system was shut down. - J. Kolleeny09/07/07: Received email from Sean Wallace of Ambient on 9/4/07, with attached SVE1 Shutdown Test Results report revised as of 9/4/07 (in eDocs): "Revised report on shutdown test of SVE system. Revisions include 2nd graph of real-time TVOC response with outside air monitoring point included. Site map with sampling locations noted (in pdf with comments). Conclusions section added to body of report. On side note, NYCDEP sewage discharge parameters do not include any SVOCs. As part of recent bi-annual monitoring required for this project, we took grab sample of GW coming into Oil Water Separator unit. This is untreated GW that after separation is discharged to sanitary sewer. There were no VOCs above detection limits. I am assuming that even if all parameters on list were passing quality, presence of SVOCs would still prohibit direct discharge to sewer? We will have monitoring report to you shortly." I spoke with Sean and said I don't think there are DEP discharge limits for specific SVOCs, but he should check with DEP. On 9/7/07, I completed review of revised report, which concluded that residual soil contamination poses no threat to human health via vapor migration into occupied spaces and recommended discontinuing operation of SVE1 system. I issued letter (in eDocs) to Alan Krupski of CBS (cc to Sean Wallace) approving this recommendation, and noting that sampling & gauging of monitoring wells for dissolved-phase contam and product, and operation of perimeter wall tap drains and oil/water separator should continue. - J. Kolleeny06/06/08: Reviewed Aug.'07 and Feb.'08 Semi-Annual Monitoring Rpts by Ambient Grp. (in eDocs). Aug.'07 rpt presents results of GW sampling done 8/16/07, showing low to moderate levels of VOCs in some wells (including MTBE up to 195 ug/L), and moderate levels of some SVOCs in influent to oil-water separator. Well gauging shows measurable product in only 1 well, B5, at 0.01 to 0.02 ft. Report recommends continuing operation of perimeter wall drain tap & oil-water separator system in basement of 513 W. 56th St.

bldg until influent concentrations of target compounds allow direct discharge to sewer, and continuing semi-annual product level gauging and GW sampling of basement and perimeter wells. Feb. '08 rpt presents GW sample results for 2/8/08, showing some increases in dissolved contam levels in number of wells; product detected in 2 wells - B5 at 0.02 ft. and B9 at 0.1 ft. Sample of influent to oil-water separator showed almost no contaminants detected, with 11.35 ug/L total VOCs, and 4.84 mg/L TPH. Report recommends continuing semi-annual product gauging and GW sampling, and notes that continued operation of perimeter wall drain tap & oil-water separator system may not be necessary and may be able to be shutdown or replaced with an alternative device more appropriate for existing conditions. On April 28, 2008, Sean Wallace of Ambient Grp sent me an email asking for response to Feb. '08 report; I replied that report didn't actually make a proposal requiring approval/disapproval. Therefore, Ambient prepared and submitted report called: "Request for Cessation of Groundwater Treatment Portion of Remediation Activity at...[site address]," dated 5/7/08 (in eDocs). I reviewed report, noted that although influent to oil-water sep had no significant VOCs for last two samples, in Feb. and March '08, SVOCs were not analyzed in Mar.'08 sample and had only one event with no detections (in Feb.'08; SVOCs were also not analyzed in Nov. '07 sample, and Aug. '07 sample had SVOC exceedances). I sent email to Sean Wallace: "I've been reviewing Request for Cessation of GW Treatment...etc., dated 5/7/08 and I noticed in table presenting results of samples of untreated GW entering oil-water separator, that samples were not analyzed for SVOCs during Nov. '07 and Mar. '08 sampling events. Sample collected in Feb. '08 was analyzed for SVOCs, results were below detection limits. I request that another sample of system influent be collected & analyzed for VOCs and SVOCs, to provide another data point and confirm absence of contamination in GW collected by perimeter wall drain tap system, before issuing approval to discontinue operation of that system. Please let me know if this request can be accomodated." Sean sent reply saying they will collect sample next week. - J. Kolleeny06/30/08: Received pdf of Request for Cessation of Groundwater Treatment Portion of Remediation Activity report, revised June 25, 2008, from Sean Wallace of Ambient Group (212-944-4615) via email on 6/25/08 (in eDocs), got hard copy on 6/27/08. Report is same as May '08 report except now has data for influent sample to oil-water separator for 6/4/08 showing all VOCs and SVOCs below detection limits, with mentions of new data in text. I sent letter (in eDocs) approving request to discontinue operation of perimeter wall drain tap and oil-water separator system by email and regular mail to Thomas Guzzi (tjguzzi@cbs.com) of CBS (replaced Alan Krupski), with email cc to Sean Wallace. - J. Kolleeny11/10/08: Received hard copy of Sept. 2008 Semi-Annual Mon Rpt by Ambient Group, dated Oct. 23, 2008 (in eDocs). Rpt notes that Sept. '08 sampling event show some increases in dissolved-phase contam in basement wells, and states that compounds detected and their ratios are more indicative of gasoline than diesel/heating oil; however, I note that highest compound in each sample was naphthalene. Four basement wells had measurable free product, up to 0.18 ft. Rpt recommends continuing with semi-annual product gauging and GW sampling. - J. Kolleeny10/28/09: Completed review of April 2009 Semi-Annual Mon Rpt by Ambient Group, dated June 24, 2009, hard copy received on July 13, 2009 (in eDocs). Rpt recommends cutting back semi-annual GW and product monitoring schedule to annual, but I

noticed that 0.6 ft. of product was detected an outdoor well (C2, aka MW5). I called Sean Wallace of Ambient on 10/27/09, said I'd like GW monitoring to continue semi-annually, and that I wanted free product removed by vac truck and wells gauged more often for product. Also asked that future rpts have historic GW and product thickness data (instead of only for most recent event as this rpt had). Sean agreed, and also sent table with historic and most recent product data (in eDocs). On 10/28/09 I sent email (in eDocs) to Thomas Guzzi of CBS, cc's to Bill Grieco of CBS and Sean Wallace of Ambient: "I have completed review of April '09 Semi-Annual Mon Rpt by Ambient Group dated June 24,'09, received by DEC on July 13, '09. Rpt recommends change in frequency of GW sampling at site from semi-annual (i.e., twice yearly) schedule to annual schedule. This recommendation cannot be approved at this time. Data in rpt indicate that one of outdoor monitoring wells, C2 (aka MW5), had 0.6 feet of free product when last gauged in April '09. Removal of free product at spill sites is considered high priority by DEC. We require that product be removed from this well, preferably by vac extraction to exert influence on area around well and encourage addt'l product to come into well, and that rate of product recharge into well after recovery event be monitored to determine appropriate schedule for ongoing gauging of well for product and for future product recovery events. Meanwhile, sampling of GW from indoor and outdoor wells for presence of dissolved-phase GW contam should continue on semi-annual basis; since last sampling event was on May 1, '09, next semi-annual sampling event should be performed first week of Nov. '09. Results of product recovery event and product recharge monitoring, as well as upcoming GW sampling round, should be presented in next semi-annual monitoring rpt, with appropriate recommendations for further action. Rpt should include tabulated historical GW and product thickness data, in addition to recently collected data. Please feel free to contact me if you have any questions." - J. Kolleeny11/09/09: Received email from Sean Wallace of Ambient: "To keep you up to date. We've scheduled remediation contractor for this week and should be able to have rpt ready prior to holiday. I also went to site (11/6/09) to check on conditions of well that had free product, C2, which was purged during April 2009 event. There was no free product detected, but there was noticeable odor in this well and one adjacent to it, B23. These two are deepest wells and are right next to foundation wall of building to west. But I just wanted to let you know that there is no free product accumulation in well since last measured April 30, 2009. Inside well B17 that had 0.05 ft reading on free product before being pumped in April also has no free product at this date. Our full rpt, as I say, should be available before holiday." - JK12/08/09: Reviewed Nov. 2009 Semi-Ann Mon Rpt by Ambient Grp, dated 12/2/09 (in eDocs). Rpt presents results of Nov. '09 GW sampling & well gauging. Two basement wells had relatively small amts of free product (B9 had 0.03 ft; B10 had 0.12 ft). Perimeter wells had no product or VOC exceedances. Courtyard & basement wells had moderate levels of total VOCs, mostly consistent with previous results; worst basement wells were B8 with 208 ug/L total VOCs, B10 with 202 ug/L TVOCs, and B21 with 201 ug/L TVOCs; worst courtyard well was C2 with 874 ug/L TVOCs (well had free product in April '09); other courtyard wells had much lower TVOCs, in 30-40 ug/L range. Ambient Grp recommended continuing semi-annual monitoring of all wells, with product recovery when detected; short-term (3-month) study of weekly vac truck pumping or other means of applying vacuum to basement wells

to see if product recovery can be enhanced in this way; and development of enhanced bioremediation stragegy, possibly with targeted use of existing SVE (dual-phase?) system for hydraulic control. If this last strategy is adopted, short-term vac truck study will not be done. This will be discussed at upcoming meeting. - JK12/11/09: Attended meeting at CBS, with Sean Wallace of Ambient Grp, Chris Tomasello of Reliant Consulting Svcs., Inc., Thomas Guzzi and William Grieco of CBS. Chris Tomasello presented plan for addressing remaining contam, involving application of combo of bioremedial solutions and surfactant. I mentioned that bio may not be effective if there is remaining free product in subsurface; Chris said they would try to recover as much product as possible by vac truck before beginning. I asked how they would establish hydraulic control (necessary when surfactant is applied to ensure contam doesn't migrate); Chris suggested us of vac truck on down-gradient wells. I said I would have to check with other DEC to see if that's acceptable. Chris mentioned that he has used this approach successfully at other sites. I asked if they had info on screened interval of existing wells, and said it would be good in general if they had clear 3-D picture of subsurface beneath bldg, including shape of bedrock and thickness of aquifer, before implementing plan; Chris agreed that they needed to do some addt'l site characterization work. Sean said they already had some info re: depth to bedrock and aquifer thickness, and would sent it ASAP. Received email with subsurface profiles and aquifer info from Sean later in day (in eDocs). Meeting concluded that they would examine wells and put together plan for addt'l site characterization and submit. - J. Kolleeny04/07/10: Sent email inquiry to Sean Wallace of Ambient Grp: "Can you give me update on site? When we met in Dec. '09, we agreed that Chris Tomasello would put together a work plan for addt'l investig to delineate soil contam and determine subsurface bedrock configuration, so that he can design remedial plan. Any progress on that? Also, I was wondering if recent heavy rains have caused any unusual appearance (or disappearance) of free product from wells? Have wells been gauged for product recently? (How often are they checked?) If wells haven't been gauged for product since big rains of March, I'd like to request that they be checked." I got email reply from Sean: "Last week Chris and I went out with borescope and confirmed well construction type. Basement wells are slotted down to bottom. So both above and below water line. Two of courtyard wells are not slotted at all. These were historically part of first 5 monitoring wells established. All other wells that are labeled B are of slotted construction type. Chris is putting together statement of our findings. We took readings today also and found very little change since last monitoring event. Only one well had measureable free product at 0.05" and it was well that has almost always had small amount. Two of wells that are usually dry did have some water, but in general, and I'll have to put chart together, I didn't notice that water level was significantly different. Today we had vacuum truck suck out all wells and tomorrow we'll gauge recharge and then take water samples. After this we'll be in position to write rpt with recommendations either for further vacuum truck events or possibly a soil washing/bioremediation event." He then sent follow-up email: "I just compared water levels and there is an extra 0.5' to 1' of water in most wells. More soon!" - JK06/07/10: On 5/19/10, received email from Sean Wallace of Ambient Grp with pdf of April 2010 Semi-Annual Monitoring Rpt (in eDocs). On 6/4/10, received hard copy of rpt, plus

pdf of lab data (in eDocs). On 6/7/10, sent email to Sean noting that rpt did not include product thickness data. Got email response from Sean with attached recent and historic product thickness data (in eDocs); email stated: "Here are water levels from May 26th visit on Page 1. Two wells with measureable free product in usual spot (B9 & B10) and B8 is showing some slight product, which it hasn't for awhile. But in Aug 2006 B8 had 1.7 ft (see Page 3 for historical summary of oil layer thickness detected in each well). Page 2 is a map of basement to show locations and also to correlate with graph on Page 4 where I attempt to represent graphically relation of water level to bedrock depth, as measured in each well. Note that lines of well are marked on diagram as A, B, C, D, and E. These are East West gradient. I took liberty of trying to show North-South gradient for Courtyard section and a slice through middle of basement that covers area where free product persists." Will review rpt. - JK07/09/10: Finished review of April 2010 Semi-Ann Rpt by Ambient (in eDocs). Sent email (in eDocs) to Thomas Guzzi of CBS, cc's to William Grieco of CBS and Sean Wallace of Ambient, approving rpt recommendations: "I have reviewed April 2010 Semi-Annual Monitoring Rpt for this spill site, by Ambient Group, Inc. Report recommends: 1. Continuing bi-annual (i.e., twice yearly) monitoring of all wells, with vacuum truck removal of any measurable free product;2. Performing short-term (3-month) study of free product development using vacuum truck pumping of basement and courtyard wells to influence areas around the wells and evaluate if free product recovery rates can be enhanced in this way.3. Presenting to CBS an enhanced remediation strategy to help move spill case toward closure, involving use of bioremediation in conjuction with soil washing to move residual oil from unsaturated zone soil to water table where it can be recovered by pumping. These recommendations are approved. Ambient Group should proceed to implement recommendations. Feel free to contact me if you have any questions." - J. Kolleeny12/20/10: Received email from Sean Wallace of Ambient Group, with attached pdf file: "Please find attached rpt [in eDocs] for 2nd monitoring event of 2010. Please let me know if you require anything else at this time. I am preparing rpt on effects of vacuum truck pumping (3 events, to be completed by end of year) under separate cover." - J. Kolleeny12/29/10: Reviewed Nov. 2010 Semi-Annual Mon Rpt by Ambient Group, dated 12/20/10 (in eDocs). Rpt summarizes Nov. 2010 GW sampling event, showing low to moderately low levels of dissolved VOCs in basement wells, very low VOCs in courtyard wells. Basement well B5 had "small but visible layer of oil in sample bailer." Rpt states that Ambient will continue bi-annual monitoring of wells, with removal of free product by vac truck when detected, and that Ambient will present an enhanced remediation strategy to help move spill toward closure; bioremediation will be discussed in conjunction with soil washing to mobilize potential residual product from vadose zone to water table where it can be recovered by pumping. - JK03/11/11: On 3/10/11, received email from Sean Wallace of Ambient Group with attached pdf file of Jan. 2011 Spill Monitoring Addt'l Rpt: Brief Rpt on Effects of Vacuum Truck Pumping for Enhancing Free Product Recovery (in eDocs). Email stated: "Please find attached our rpt on effects of vacuum truck pumping on enhancement of free product recovery at this site. Our next scheduled Monitoring event is in May. We plan on taking some water level measurements next month (April)." On 3/11/11, I sent email: Thanks for pdf file of rpt. I note that you are now recommending annual GW sampling and periodic product recovery as needed. What happened to

idea of bioremediation plus soil washing to de-sorb residual oil from soil, as mentioned in Nov. 2010 Semi-Annual Rpt? Is that no longer being pursued as remedial approach? Please let me know about, and then I will respond to this rpt's recommendations." Sean Wallace sent reply: "Soil washing has been recommended, as you note. However, our client has many levels of decision makers and, as consultant, we are not made privy to mechanism they are using internally to consider further remediation. Our November recommendation was put forth as way to bring closure within a year and I will make that case to them again as we approach next scheduled monitoring event. In absence of remedial action, we feel it would still be acceptable to monitor dissolved concentrations on less frequent basis, as long as more frequent checks for free product were in place, as a precaution. If your dept recommends that we follow up on our Nov 2010 rpt suggestion of soil washing, based on lack of progress with vacuum truck method, then we would of course assist our client in moving forward with that remediation step. Main concern expressed is that there is no 100% guarantee of success and I believe this lack of certainty is cause for hesitation. One train of thought is if levels of dissolved hydrocarbons measured in wells remain consistent, client may wish to pursue a more passive approach. However, if DEC suggests more active remediation, that would carry weight." Rpt presents data on product thickness before & after vacuuming thru Dec. 2010; data show traces of product (up to 0.03 ft. in Dec. 2010, up to 0.07 ft in May 2010) in couple of wells. Rpt recommended reducing dissolved-phase GW sampling from semi-annual to annual, gauging wells for product quarterly and doing vacuum recovery as needed. - JK 4/22/11: I sent email to Sean Wallace of Ambient Group: "Sorry it's taken a while to get back to you about this site. Recommendation in your last rpt to change GW sampling schedule from semi-annual to annual is not approved. DEC's mission is to move spill cases toward closure in an expeditious manner. Semi-annual sampling is not onerous, in my opinion, and will do better job of establishing trends in contaminant levels than will annual sampling. Product recovery may be performed periodically on an as-needed basis, as recommended. However, I would still prefer that Responsible Party follow up on earlier suggestions about developing an enhanced remediation strategy to move this case more quickly toward closure." Received email reply from Sean Wallace: "Thank you. We will inform our client of decision and of preference to follow previous path, i.e., soil washing leading toward expeditious closure." - J. Kolleeny06/09/11: On 6/7/11, received email from Sean Wallace of Ambient Group, with attached pdf file of May 2011 Semi-Annual Mon Rpt dated 6/7/11 (in eDocs); email stated: "Here is rpt for first bi-annual monitoring event for 2011. We are preparing recommendation for an enhanced remediation strategy to present once more to our client, CBS." Will review mon rpt. - JK08/09/11: Reviewed May 2011 Semi-Annual Mon Rpt by Ambient Group dated 6/7/11. Rpt presents May 2011 well gauging & sampling data showing small amounts of product detected in basement wells B5 and B10 ("1 cm visible in 1/2-inch diameter bailer"), and for dissolved-phase, low concentrations of VOCs in several wells ranging up to 104 ug/L total VOCs in B8. Rpt states that basement wells continue to show oil impacts, and based on data, Ambient Grp recommends continued semi-annual monitoring, removal of product as needed by well purging, and they will present to CBS an enhanced remedial strategy involving bioremediation and soil washing to help make product recoverable and move spill toward closure in a timely

manner. - J. Kolleeny03/07/12: Reviewed November 2011 Semi-Annual Mon Rpt by Ambient Group, dated 12/27/11 (in eDocs). Nov. 2011 well gauging & sampling data showed product detected in one basement well, B10 (amount not specified); dissolved-phase GW sampling showed low levels of total VOCS, ranging up to 85 ug/L tVOCs in well B5. Rpt states that basement wells continue to show oil impacts, and based on data, Ambient Grp recommends continued semi-annual monitoring, removal of product as needed by well purging, and that Ambient Grp will present to CBS two options to enhance remediation at site: (1) soil washing to help move residual product from soil to water table where it can be more readily recovered, and (2) bioremediation to degrade residual impacts in soil and GW. - J. Kolleeny06/05/12: Met with Sean Wallace of Ambient Group, Chris Tomasello of Reliant Consulting, and CBS reps - Tom Guzzi, Ching Li and Greg Marcy, to discuss potential remedial approach of using surfactant/soil washing to desorb product trapped in soil to expedite product recovery and bioremedial solutions with facultative bacteria to degrade residual hydrocarbons in soil and GW. CBS asked if DEC could guarantee spill closure if they proceed with this approach, Vadim Brevdo and I said we could not give a guarantee, however, we believe that this approach is likely to bring spill to closure more quickly than continuing with present approach of semi-annual monitoring and vacuuming of wells with product. I noted that any remedial work plan proposing soil washing & bioremediation would have to show that sufficient numbers and locations of injection points can be installed at site to adequately target area(s) of concern, and plan would have to show that there are sufficient numbers and distribution of potential product collection points to control and prevent any migration of mobilized product off-site. Tomasello indicated both conditions can be satisfied. Sean Wallace mentioned that another semi-annual sampling event was recently performed and a rpt will be coming soon. - JK06/22/12: Reviewed May 2012 Semi-Annual Mon Rpt by Ambient Grp, dated 6/10/12 (in eDocs). Rpt presents results of May 2012 gauging and sampling event. Prior to pumping with vac truck, basement well MW-10 had 0.05 ft of free product; after pumping, basement wells B5 and B10 had traces of free product (0.01 and 0.02 ft, resp.). Several wells continued to have low levels of dissolved VOCs: B11 had 92 ug/L total VOCs, B8 had 89 ug/L tVOCs, B9 had 47 ug/L tVOCs. VOC levels have generally decreased over time. Rpt recommends continuing bi-annual monitoring of wells, with removal of free product via well purging as needed, and states that Ambient Grp will present to CBS two options to enhance site remediation: (1) soil washing to help move residual product from soil to water table where it can be more readily recovered, and (2) bioremediation to degrade residual impacts in soil and GW. - J. BROWNFIELDS:

Program:	BCP
Site Code:	416811
Site Description:	Location: The Off-site Clinton Green Development Project Site, defined by a shallow off-site petroleum-contaminated groundwater plume, involves the intersection of West 53rd Street and 10th Avenue in Manhattan, New York City.Site Features: This location is an urban area of commercial/light industrial and residential use including multi-story buildings, sidewalks and open city streets. A paved elementary school playground is located on the southeast corner of this intersection and the Hudson River is approximately two blocks west of the Site. Zoning/Historical Use: The Site is in an Environmental Zone which is part of the Clinton Green Urban Renewal Area. This is an off-site remedial project associated with the now-completed Clinton Green Development Brownfield Cleanup Project.Site Geology and Hydrogeology: The depth to groundwater ranges between 12 to 20 feet below the surface. The soil, below the urban fill, is fine to coarse-grained sand. Bedrock is encountered between 11 feet and 15 feet below the surface.

OFF-SITE CLINTON GREEN DEVELOPMENT PROJECT (Continued) **S106906459**

Env Problem: Nature and Extent of Contamination: The on-site source area (Clinton Green Development BCP Site) was cleaned up by Dermot Clinton Green in 2006, and this project includes the remediation of the off-site petroleum-contaminated plume.Contaminants: Based upon investigations conducted to date, the primary contaminants are petroleum-related volatile organic compounds (VOCs) in a shallow off-site groundwater plume. Concentrations: Concentrations of benzene in the groundwater ranged from non-detect to 330 parts per billion (ppb), exceeding the groundwater standard of 1 ppb. Ten other VOCs also exceeded the groundwater standard. Naphthalene (290 ppb) was the only semi-volatile organic compound detected and it exceeded the groundwater standard of 5 ppb. This very localized plume has migrated off-site approximately 100 feet down-gradient. Significant Threat: The BCP site presented a significant environmental threat due to the off-site release of contaminants from source areas.

Health Problem: Direct contact with contaminated groundwater is not expected since contamination is located at depth and below pavement. Ingestion of contaminated groundwater is not expected since the area is served with public water. An evaluation of the potential for vapor intrusion to occur is part of the approved Remedial Action Workplan currently underway.

Program: BCP
Site Code: 57349
Site Description: The site consists of several parcels located on West 53rd Street between 10th Avenue and the Amtrak easement, on West 52nd Street adjacent to the east side of the Amtrak easement, and along the Amtrak easement between West 51st and 53rd Streets in the City of New York, Borough of Manhattan. Railroad tracks pass through the site. A former ExxonMobil gas station was present on this portion of the Site from approximately 1950 - 1992. By February 2006, all original buildings on-site were torn down and all on-site contaminated soil was excavated and removed off-site. The property is currently owned by Dermot Clinton Green LLC.The Site now consists of two residential towers, a mixed-use low-rise building, public park, and subsurface parking garage (all currently under construction).A Certificate of Completion was issued on October 20, 2006.

Env Problem: Past environmental investigations revealed that this BCP site had on-site and off-site petroleum impacted soil and groundwater as a result of petroleum spills from the former Exxon/Mobil Service Station at the corner of 53rd Street and 10th Avenue. Dissolved phase groundwater contamination (BTEX, lead and MTBE) has impacted the shallow groundwater table exceeding standards. An adjacent off-site building has experienced liquid petroleum in the basement. On-site and off-site remedial work occurred in early 2000. Although all on-site contamination has been removed through the BCP program in 2006, an off-site groundwater plume still exists and additional cleanup work is required to remediate the off-site contamination. The City of New York has accepted the responsibility for the off-site contamination and a final Site Investigation Work Plan was approved by NYSDEC on February 9, 2009. Field work will begin in the spring of 2009.

Health Problem: All on-site contamination has been remediated through remedial actions completed in 2005-2006. Remedial actions included demolition of all site buildings, removal of all soil to the top of bedrock, and associated dewatering of the site. No contamination is known to exist beneath the top of bedrock. Therefore, all on-site exposures have been

OFF-SITE CLINTON GREEN DEVELOPMENT PROJECT (Continued) **S106906459**

mitigated.A shallow off-site petroleum-contaminated groundwater plume was documented in 1993 (NYSDEC Spill No. 93-08101). Migration of the plume has been limited due to the geology of the area. NYSDEC is currently pursuing the responsible party (Clinton Green OU#2) to investigate and remediate any off-site contamination.

Riteway responding with vac truck and 7 men to perform cleanup. Unsure if #2 oil in tank will be pumped or burned. DEC Patel to respond.09/20/11-Hiralkumar Patel.1:36 PM:- spoke with Pete at Riteway. he received call from Statewide oil as the subject site is Statewide Oil's customer. Pete was informed that an unknown oil company delivered about 9,000 gal oil into a 20,000 gal tank. as per super, oil spilled from manway inside the tank room only. no spill at the vent pipe. Pete was informed that there is about 2 inches of product in tank room.alternate addresses: 737-751 10th Ave, 501 W 50th Street, 517 W 50th Street, 525-545 W 50th Street, 500 W 51st

Frank mentioned that they have two (2) 20,000 gal #6 oil ASTs on legs/saddles (not one 40,000 gal #6 oil UST as mentioned in PBS). this morning, he found 11,000 gal oil in south tank and now the south tank is full which means 9,000 gal #2 oil was delivered to the south tank. Frank mentioned that the spilled oil is completely contained inside the tank room and no odors in building other than basement. he also confirmed that no odors in adjacent school building. Frank mentioned that they will do necessary adjustment on boiler and will use the #2 oil delivered to the tank. asked him to stop further oil deliveries until the manway is fixed.2nd floor 10019Flora Buckley **property manager**Ph. Frank mentioned that they are only using south tank and the north tank is completely empty, but not abandoned. north tank is ready to be used at any time. mixture of #2 and #6 oil spilled from a manway on top of south tank. as there is block wall on west and south side of tank room, oil seeped through block wall into apartment building’s boiler room and into school’s tank room. there is a sump located in northwest corner of the apartment’s boiler room and minor oil found into this sump. there is another sump right across the wall from apartment’s boiler room sump, in the northeast corner of the school’s boiler room. no oil found in shcool’s boiler room sump.90% of the shcool’s tank room is within the apartment’s boiler room footprint. and that could be the reason for

not having any oil in school's boiler room sump. Frank mentioned that the floor underneath the both tank/boiler rooms is more than 1 ft thick (the main floor for 38 floor apartment building).Riteway crew was on site pumping oil from tank rooms. inspected remote fill port/vent pipe for both apartment building and school. no sign of any release at any fill port or vent pipe. asked Frank either to fix manway immediately or seal the fill port for south tank. Frank mentioned that Riteway will replace manway cover before leaving the site today.during inspection of the school's tanks, found leak from manway of the north tank.all the lines to and from both tank sets runs aboveground except part of remote fill line runs under sidewalk.Frank mentioned that due to sidewalk shed along W 51st Street, no one from aprtment building noticed truck delivering oil to the tank.based on available ACRIS record, entire site (including apartment building, parking garage and school) owned by NYC Dept. of Education and then the apartment building portion was leased to Hudsonview Terrace Apartment.09/21/11-Hiralkumar Patel.9:13 AM:- spoke with Frank. he confirmed that oil in apartment's tank and boiler room was cleaned yesterday and Riteway tank is on-site now to cleanup oil in school's tank room.09/23/11-Hiralkumar Patel.3:58 PM:- spoke with Pete at Riteway. he mentioned that spill in school's tank room is cleaned. but they are still cleaning up contaminated material (mostly dirt) in the building's tank room.09/26/11-Hiralkumar Patel.3:00 PM:- visited site. met Frank. inspected both tank rooms and boiler rooms. found mostly water inside the school's tank room and some minor oil droplets. found some oil in apartment building's tank and boiler room. no odors noticed in any area. oil found in basement could be oil left in block walls. asked Frank to have all oil cleaned up. he will talk to Riteway.09/27/11-Hiralkumar Patel.1:35 PM:- spoke with Pete at Riteway. he mentioned that Riteway crew is on site cleaning up the remaining oil.10/20/11-Hiralkumar Patel.1:12 PM:- spoke with Pete at Riteway who confirmed that cleanup was completed.based on available information and observations during site visits, case closed.

Environmental Interest/Information System

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

FIS (New York - Facility Information System) is New York's Department of Environmental Conservation (DEC) information system for tracking environmental facility information found across the State.

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include;

Environmental Interest/Information System

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

FIS (New York - Facility Information System) is New York's Department of Environmental Conservation (DEC) information system for tracking environmental facility information found across the State.

MOBIL OIL-#17-JWN MOBIL (Continued) **1000553810**

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

David Smith, Bureau Director, Remedial Bureau B.This spill has been consolidated under spill No. 8904939DEC Sigona performed field inspections on 10/22/2002 and 10/23/2002 and observed 4,000 gallon steel tank removal activities. There were low levels of

petroleum contamination on the tank top and overburden. When the tank was removed at approximately 11:30 A.M. on 10/23/2002 there was petroleum contamination and free product sheen on the water table visible in the tank excvataion. The concrete pad was removed underneath the tank.The DEC Sigona requested that the excavation be backfilled with pea gravel to enhance the vapor recovery effort. The tank was located immediately adjacent to the foundation wall for the Bull McCabe Restaurant located downgradient of the site. GSC indicated that monitoring wells and pea gravel will be installed at the former 4K tank location. AJS 10/24/2002.

Remarks: Elevated Photo-ionization detector readings found in soil samples collected from tank pit following tank removal - The site has an active remediation case on-going

(Sigona)10/12/2004: Consent order and Corrective Action Plan were executed by the Regional Director. (Harrington)3/29/2005: Building at 714 11th Avenue was evacuated by FDNY due to elevated levels of gasoline vapor in basement (~11% LEL). Vapor intrusion caused by air rotary drilling at Mobil site as part of station regrade activities. (Harrington)3/31/2005: Site visit conducted. Met with representatives of Exxon Mobil, Salomone Brothers, Trammell Crow, and the Bull McCabe restaurant. Contacted Chief John Belnavus (FDNY Batallion 9) to discuss the stop work order issued. He lifted the order after our conversation, as Exxon Mobil had presented a satisfactory plan to avoid any further vapor issues in the adjacent building. (Harrington)6/2/08- DEC Piper. SPill staff recieved notifaction that approx 5 gallons of gasoline was discovered in soil in an excavation adjacent to site. Spill 0802247. This spill has bee nclosed and referred to this spill.4/4/2005: Approved RAP amendment during on-site meeting. (Harrington)4/7/2005: Approved RAP amendment #2 during on-site meeting. arise. (Harrington)8/17/2006: Sent an e-mail to Exxon Mobil approving the hydraulic lift removal report. (Harrington)8/29/2006: Sent an e-mail to Exxon Mobil approving the sensitive receptor survey report. (Harrington)2/6/2007: Project transferred from Harrington to Smith (central office) for management. (Smith)4/19/2007: Approved the installation of two additional remedial wells to expand the Soil Vapor Extraction system. Performed site visit on April 18, 2007. (Harrington)8/3/2007: PM visited the site with Kleinfelder Personnel (Mooney, Meyerhoefer). O & M of SVE system is on-going. Kleinfelder will soon be proposing the abandonment of several off-site monitoring wells. (Harrington)2/18/2008: PM sent e-mail to Exxon Mobil regarding the SVE system expansion. Based on increased BTEX concentrations in groundwater (wells RW-2 and VP-MW-9), a revised groundwater remedial strategy shall be proposed by Exxon Mobil. (Harrington)12/4/08 - Haggerty: Assumed management from Dave Harrington3/2/09 - Haggerty: Approved Reporting Reduction Request. Sampling will remain quarterly, SVE/AS system maintanence will remain on 2 week schedule, reporting will now be bi-annually. System has been operating since 2001 and functioning well. 7500ibs of mass recovered at this point6/11/09 - Haggerty: Approved Hydraulic Lift Removal Report. Some SVOC detection above soil guidance but not high enough to warrant further excavation. Hydraulic fliud analyzed for the presence of PCB's, no detections. No spill # was called inMay 2010 - PM approved Subsurface Investigation and Biological Enhancement/ Chemical Oxidation Work Plan. New Spill (0909441) called in because of EM Phase II workJune 2010 - 70,000ppb dissolved BTEX in groundwater encountered along the western boundary of the site. PM required additional delineation including bedrock monitoring well August 2010 - approved SI workplan. Includes delineation of the upppermost aquifer and bedrock aguifer. Bedrock wells will be cored to inspect for fracturing and evidence of flowing groundwater such as oxidation (rust) of metals within the rock. Bedrock wells will isolate the bedrock aquifer - screened portion of PVC in bedrock with bentonite seal above and below bedrock interfaceNovember 2010 - EM has handed the project over to Liberty Petroleum Realty LLC. See 11/18/10 letter from Liberty. (sd)February 2011 - Supplemental SIR under reivewMarch 2011 - Reviewed SIR. Required additional delineation west of the site along West 51st Street also to provide report on the effectiveness of ISCO injectionsMay 2011 - approved work plan for additional off-site delineationAugust 2011 - the 2 additional wells couldn't be installed. They couldn't reach the Arcadis minimum pre-clear depth of 6.5ft plus utilities are very tight in that area. Arcadis will have to design an alternate way of providing the dataNovember 2011 - approved shutting down the system immediately to allow for the site to reach static conditions before the VTE events -Proceed with the VTE Pilot test as soon as possible (within 30 days). -The RAP is due is 75 days from today's date (10/26/11).December 2011 - VTE Pilot test could not be performed in December due to the DOT Holiday embargo. Moved to January 2012February 2012 - Based on the proposed geochemical sampling/ IRM results, the Remedial Action Work Plan is due by April 30, 2012May 2012 - Arcadis submitted a RAP which is approved contingent upon minor alterations. The issue now is getting the new RP, Liberty, to sign a CO with oversight costs. EM already has a site-specific CO for this property from 2005, but since they

	are switching remedial technology, we are justified in asking for additional oversight costsJune 2012 - Consent Order executed with Liberty PetroleumAugust 2012 - TPE wells and one delineation well will be installed in early Sept. I granted Arcadis a short extension. They inquired as to whether they need a Amtrak permit (the track was over 500ft away) and that slowed down the process.December 2012 - Dual-phase extraction wells have been installed and trenching completed. Sewer connection possibly completed (unable to speak with the Arcadis PM but it should be). Also, the SVE system was shutdown indefinitely

DEC Memo:	Prior to Sept, 2004 data translation this spill Lead_DEC Field was "KRIMGOLD"1/3/99Spoke to Nick. He is working for the Arch Diocese. When they uncovered the tank to isolate and retest, they found a hole in the top of the tank - there was no soil contamination noted. They are proposing to close the tank in place with foam, but due to restricted acess (in a courtyard) they are unable to remove the 5000 gallon tank. They are proposing to cut throught the bottom of the tank in two locations to collect soil samples. He will forward a summary of the exposure and the analytical (8021 and 8270) to my attention. JMR2/25/00 REPORT RECEIVED.01/26/04REassinged from Rommel to Austin02/17/04: Reassigned from AUSTIN to KRIMGOLD.07/28/05 Tank Closure Report indicates tank was filled with Polyurethane Flowable Foam and closed in place 01/06/00. DEC Memo:	Prior to Sept, 2004 data translation this spill Lead_DEC Field was "KOLLEENY"11/07/05: This spill transferred from J.Kolleeny to S.Kraszewski.11/30/05: Reviewed Post-Excavation Site Assessment Report prepared by Emipre Environmental Services, submitted December 2002. 650 tons of contaminated soil was removed and disposed of by Allied Waste. Six end point samples were taken from excavation area and analyzed. Two samples show 5 SVOCs above RSCO standards. Only one sample had a PID reading: 0.4ppm. No VOCs were detected. However, depth of the soil borings are not given for any samples taken. Nor is it mentioned if GW was encountered during borings or during tank excavation. Also, no fill port labeled on the diagram and no sample taken at fill port. Must call about fill port and samples. - SK01/04/06: Only contact number available is for Derek Martin, Heating Coordinator for NYCHA. Several unsucessful attempts to contact him thus far. Will continue to try and reach him. - SK01/09/06: Frank Inoa from NYCHA called with additional information about the assessment report. The report contains information about the piping: the vent and fill lines were capped and the suction and return lines were removed. Soil excavated during removal of these lines was also disposed of properly. It is not likely that GW was encountered during the excavation. Frank called the consultant for more information and is waiting for their call. - SK01/13/06: Frank Inoa from NYCHA called with additional information for the site assessment. Soil along the fill lines and near the fill port was removed but samples were not taken. Talked with Jon about this situation and we decided that the site assessment was incomplete without the sampling of the fill port area and along the fill lines. I will email Frank a notification of remaining work to be done at the site:Sampling of the fill port areaSampling of the vent, fill, suction and return line area for every 20 feet of pipingA Work Action Plan for review by the Department - SK03/17/06: Sent out Email to Chris Sawyer mentioning additional soil borings along the fuel lines and next to the fill port. - SK11/28/06 - JKann - report submitted on 11/14. DEC lead transferred from S.Kraszewski to J. Kann.07/03/09 - J.Kann - work plan for investigation submitted in March 2009. Additional work proposed around the old fill port and lines. Email sent on July 3 include the following : "- The June 2006 report identifies an area of concern due to shallow contamination (SB-04). The focus of the 2009 work plan should be on this area. Based on the 2006 report, boring logs and the report indicate no petroleum odors or PID readings in the shallow samples of SB-6 and SB-5. Why are additional borings proposed in this area?"09/15/09: J.Kann - GF's

HARBORVIEW HOUSES -NYCHA (Continued) **S104275582**

response was "As for Harborview Houses, the borings are in a very limited space.Since SB-04 was the boring area of concern, a couple of the newdelineation borings surrounding the new boring proposed in the same areaof SB-04 are at the same locations of SB-05 and SB-06. The analyticalsamples collected from SB-05 and SB-06 in 2006 were collected from 16-20feet below ground surface. There is no shallow analytical to confirmthat these areas around the fill lines and fill port are not impacted.Since that data is three years old and it was unclear where impacts werecoming from the first time, borings in the area of SB-05 and SB-06 willhelp delineate the shallow impacts."WP was approved on 07/10/09.07/22/10: J.Kann - spoke with Gordon of Clean Ventures (908)878-9043. He said that one boring included in the plan by the fill line was not able to be advanced because of a scaffold being present. He asked if it could be completed with hand auger. I said that would be fine and to collect two samples one at 2 feet and one at 5 feet because previous reports showed some shallow exceedences.10/18/10: J.Kann - SAR received on 10/5/10.11/23/10: J.Kann - comments sent to NYCHA on SAR.3/22/11: Revised report sent on 11/30/10. Minor exceedences of SVOCs in fill area along fill pipe. Boring logs describe the area as "fill material: brown m.sand, trace brick, anthracite". A qualitative exposure assessment was included in the report. NFA.

DEC Memo:	Prior to Sept, 2004 data translation this spill Lead_DEC Field was "VOUGHT"10/02/2002-VOUGHT-Spoke with Dan Caravan. Mobil station remediation going on next door to above address. Remediation system is a SVE system. Above address has a fresh air injection system for basement. Truck used to pump out SVE system had released vapors into fresh air injection system which then pumped vapors into above address. Dan Caravan took PID into above address and found non-detect levels. Caravan also installed a carbon filter at intake of fresh air injection sytem to prevent reoccurence of problem. Spill closed by Vought,

Environmental Interest/Information System
AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants.

WEST SIDE CLEANERS (Continued) **1000694312**

AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

FIS (New York - Facility Information System) is New York's Department of Environmental Conservation (DEC) information system for tracking environmental facility information found across the State.

DEC Memo:	Prior to Sept, 2004 data translation this spill Lead_DEC Field was "SAWYER"Sangesland DDOProblem with longterm bad practice with waste oil dumping. Six used oil tanks in a pit. Tanks fill up and the tanks tend to over fill and flow over into a containment pit. Long term, this oil has flowed through the cinderblock containment wall and gone down into the building basement.Chrysler Corporate office is taking lead to pay for cleanup. Building will under go a total renovation. There will be a showroom on the ground floor and service will be on the 2nd and 3rd floors. Repair of this spill is a small part of this renovation.7/21/2003-Vought-Called Kevin McGrath and left message. Vought called Chrysler and spoke with Bob Sampogne (212-765-6633) and clean up crew is working all day. Vought will perform site visit on 7/21/2003.7/22/2003-Vought-Site visit performed on 7/21. three weeks. No sewers or drains affected. Spill cleaned using speedy dry. PBS search indicated no waste oil tank registration. Vought called Sampogne and he will return call with registration information. Vought spoke to Kevin McGrath who is designing new waste oil containment room with secondary containment. According to McGrath their is another room under the AST area which is heavily impacted. No mention of the room was made by Sampogne. Site visit by Vought on 7/22 to inspect basement room. Speedy dry on basement floor with large area of oil staining over three rooms with small puddles of free product. Waste oil also found on floor of sprinkler room. Oil possibly entrapped in walls from second floor sink connected to ASTs on first floor. NYSDEC requires (in addition to above requirements) soil borings through three rooms and one in sprinkler room (a total of four borings). Vought sent letter with requirements to Melissa.7/23/2003-Vought-Spoke with Melissa who will be performing site visit on 7/30. Melissa stated that she will send email to Vought with responsible party information.7/24/03-Vought-Received call from Steven Boutin (Action Environmental 518-437-0337 (off) 518-441-7130 (cell)). Vought returned call.8/7/2003-Vought-Letter to DEC from Daimler Chrysler-Floors and walls in AST area were pressure washed and preliminary soil samples were collected from below basement floor.8/21/20003-Vought-Site visit by Vought on 8/21. Met with Kevin McGrath (EarthTec Enviro). Soil contamination found in soil boring along west wall of basement. Inspection of boiler room yielded two USTs (unknown product status) and a sump pit filled with free product. NYSDEC requires immediate 1)removal of impacted debris 2)emptying of tanks and sump pit 3)registration of USTs and waste oil tanks 4)site plan with boring locations and tank features 5)product recovery amounts 6)delineation of soil and groundwater contamination under UST room and/or endpoint sample analysis 7)disposal manifests 8)borings through base of waste oil impacted wall.8/25/2003-Vought-Received call from Steve Shoiniere (518-951-2262) from Earthtec in Albany who just spoke with Melissa Michaels. Hauler want PCB analyticals on product before disposal. Results will not be in until Wed or Thurs. This spill number comes from a "hit" found on a monitoring well associated with an ExxonMobil Station at the corner of West 51st St & 11th Ave. The specific well with the "hit" is actually closer to the Chrysler/jeep building. ExxonMobil consultant (Dan Canavan 631-285-6684) said they will run a fingerprint on the sample and may try to disassociate the "hit" from the Exxon Mobil Station. 12/21/05 Sharif/ Case was transferred to Koon Tang for reassignment.3/1/06 - project manager info. Hills, MI 48326phone: 248-512-3152Fax: 248-576-7369Reviewed case file. Only slight exceedance of a few benzo compounds in soil, e.g 300 - 500 ppb of benzo(a)antracene, and 1200 ppb Chrysene. No VOCs or CVOCs in perched water, only slight detection of SVOCs - 77 ppb Pyrene. Site is closed. - KST11/29/07-Vought-Received call from Kevin McGrath (EarthTech 518-951-2251) who called and inquired why spill was closed and also indicated that oil staining will be pressure washed from floors and water from second floor drop sink into basement. Cleaning will begin monday(11/3) and on wed(11/5), 6(250-gallon) waste oil ASTs will be removed. ASTs will be replaced with lubecubes. Two (10,000-gallon) above ground ASTs for fuel oil are not piped but floor area around vault had free product in it. Vault had free product which was removed and floors were cleaned. Vault has not been inspected in two years and unsure if product present. Consent order signed for original investigation and unsure if tanks in basement are registered.12/5/07-Vought-After review of PBS database no registration found for site. DEC requires: 1)submission of PBS registration. Site inspection scheduled for 12/7 at 1:30pm. 12/7/07-Vought-Site visit by Vought. Earth Tech onsite installing new waste oil ASTs. Vought also met with Bob Sampogne (ph:212-765-6633 fax:212-399-7449). No signs of spill from second floor sink however USTs still present in boiler room and no investigation was done of subsurface as per 8/21/03 notes above which requires delineation of soil and groundwater under UST room. Since soil and groundwater was never investigated in boiler room and since free product found in sump, Spill 0751290 was opened due to possibility of heavy soil and or groundwater contamination beneath the boiler room floor. See spill 0751290 for further info on basement spill. This spill remains closed by Vought as separate and distinct spill.

Remarks: in excess of 100 gal - contained inside of the bldg but floor is not sealed - speedy dry & pads were put down

DEC Memo:	01/04/08-Vought-Site visit by Vought on 12/7/07 due to inquiry from Kevin McGrath (Earth Tech) who stated that a site visit was suggested to confirm cleanup for spill #0304103. Vought did confirm that this spill was cleaned (spill originally from second floor waste oil sink that ran down wall). Vought inspected basement of building (note that building owned by Chrysler Financial and not be Chrylser Jeep who owned waste oil sink and hence hired EarthTech. Due to new RP for basement spill and observed staining in utility pit, lack of PBS registration (tanks in boiler room are USTs in concrete coffins) and presence of free product under floor in adjacent rooms (see spill 0304103) this spill was opened.DEC requires: 1)PBS registration 2)TTF of both tank systems 3)removal of all impacted soil and debris from boiler room utility pit and sump pits 4)submission of condition of concrete in sump and utility pits 6)cc to Francamona and Bob Sampogne (Chrysler Jeep ph:212-765-6633 fax:212-399-7449).owner as per ACRIS:LTS 711 11th Avenue330 West 58th StreetSuite 513New York, NY 10019Vought called and spoke to Francamona who indicated that he also represented the tenant and that the owner was LTS 711 11th Avenue. paint or solvent- found oil in manhole, which was 2 ft north of sump location- oil sample was collected for fingerprint analysis (SUMP)- two large inactive boilers found in tank room- no evidence of oil was observed in elevator pit area- found oily-water in sump in fire pump room; a pipe entering the sump pit was oriented in such a manner suggesting that it may be connected to the sump in the former boiler room- oil-water was sampled from sump in fire pump room (SUMP2)- fingerprint results indicated that the sample SUMP contained 24% motor oil, 18% diesel and trace of gasoline- results for SUMP2 indicated that the sample contained 26% motor oil, 24% diesel and trace of gasoline- the DRO/ORO ratios in the sump samples are comparable to those in soil samples SB01 and SB02- on 08/29/03, Earth Tech removed product using vacuum truck- approx. 10 gal of oily water was removed from sump in fire pump room; sump pit was 2 ft by 2 ft and 3 ft deep; a 3 inch pipe located approx. 1 ft below floor grade on the east wall of the sump- approx. 100 gal of oily waste was removed from sump in former boiler room- approx. 40 gal of oily waste was removed from a manhole located 2 ft north of sump in boiler room; this manhole was 3 ft by 3 ft and 3 ft deep- no pipes found entering or existing this manhole in boiler room, but found another manhole at the bottom of this surface manhole; approx. 700 gal of water was removed from this second manhole; dimension of this second manhole was undertermined; water level in the second (deeper) manhole dropped approx. 2 ft before stabilizing; as continued pumping produced no additional drawdown, pumping was discontinued (could be strom sewer)- second manhole found which was located approx. 2 ft south of sump location; could not check this as lid appeared to be welded with rim- tanks appeared to be dry as gauged through 2 inch access port- found minor VOCs in all four samples (SB01, SB02, SUMP and SUMP2)GRO/DRO/ORO

15/04: letter from Chrysler indicating release in tank/boiler room was fuel oil:- it was determined that free product in sump/manholes in boiler room is not motor oil as it is missing certain additives normally contained in motor oil- the next most likely material the free product would be fuel oil, possibly #4 or #6 oil (based on presence of fuel oil boilers in room)03/31/05: Additional Site Investigation Report:- former boiler room contains four sumps with manhole entrances (initially only two manholes and a sump was found during investigation plan), a pipe trench containing free product (which was called sump in investigation plan), a gear pump, two ASTs, two pressure tanks and two boilers- one of the four manholes (West) was welded shut (this was called manhole 2 ft south of sump, in previous investigation plan); after opening this West manhole, found sump full of free product- the north manhole also contained oily liquid- east and southern manholes were both empty of liquid; however, the manholes contained a small amount of oily debris- subsequent to fingerprint analysis of the oil, it is assumed the oil was either #4 or #6 oil- two ASTs were approx. 8,000 gal- the ASTs are located in an area of the basement that is lower than the remainder of the basement- on 02/09/05, installed nine borings

Langan engineering has been hired by property owner for required investigation.John GavrasLangan EngineeringPH. (212) 479-5406email: jgavras@langan.com08/10/10-Hiralkumar Patel.9:43 AM:- left message for John at Langan.2:36 PM:- received call from John. he requested time extension to submit tank registration and investigation of sumps/manholes. informed John that the department can't approve any time extension for waste oil tank registration (which is due on 08/16/10) and investigation of sumps/manholes (which is due on 08/31/10), but can approve fuel oil tank registration until Sep. 17, 2010. asked John to send email with extension request.08/11/10-Hiralkumar Patel. received email from John (at 5:42 PM on 08/10/10) requesting time extension until 09/17/10 for submission of PBS form for two fuel oil tanks in basement. John also asked copy of notice regarding waste oil tank registration that was issued in 2007.2:50 PM:- received call from John. informed him that Chrysler Realty and dealer both were informed verbally by DEC Vought about unregistered waste oil tanks and required to registered those tanks.during review of papers under spill #: 0304103, found old letter dated 08/27/03 requiring registration of waste and heating oil tanks. letter was addressed to Chrysler Realty Corp.4:03 PM:- sent email to John with copy of letter dated 08/27/03.4:04 PM:- sent eamil to John approving extension for submitted PBS form for two heating oil tanks to 09/17/10. email copied to Pearl Seril and Barbara Seril.08/30/10-Hiralkumar Patel.4:59 PM:- received email from Ms. Michaels including response to letter dated 07/30/10. she mentioned that dealer had submitted PBS application for their waste oil tanks, but Albany office returned that stating that landowner has to register tanks. so they have notified property owner. on 08/19/10, GZA environmental (Chrysler's consultant) and Langan (owner's consultant) responded to site to clean sumps. during inspection, they found liquid in three of the four sumps. fourth sump was full of debris. GZA environmental and Langan collected liquid samples from sumps and pump out three sumps. after liquid removed from sumps, they found another manhole cover at the bottom of sumps. GZA removed second manhole cover and found more liquid. the depth to the bottom of newly-discovered liquid was measured to be about 8 ft from the basement floor, or 5 ft from top of second manhole. Chrysler believes that these sumps are actually access ports for two old USTs under basement floor. contractor removed approx. 7,500 gal of oil water mix from sumps and UST. GZA returned on 08/26/10 to check water level in northwest man-way of UST. in one week time the level in tank did not vary significantly. the suspect USTs and sumps are not connected to the municipal sewers. Chrysler has informed property owner about these old USTs. Chrysler also informed property owner about registration of all tanks and close out of old USTs and fuel oil ASTs. Chrysler will submit results of liquid samples collected from sumps, once available.08/31/10-Hiralkumar Patel.11:16 AM:- sent email to Barbara Seril and Pearl Seril including response from Chrysler and asked them to call to discuss their findings. email copied to John at Langan.3:11 PM:- received call from Dorit Ungar, attorney representing property owner. she requested another three months

MANHATTAN CHRYSLER JEEP DODGE (Continued) **S108982853**

extension to complete tasks listed in letter dated 07/30/10. based on available information, informed Ms. Ungar that the Department approves only one month extension to finish required work. as such, on-site tanks registration must be done by end of Sep. 2010 and cleanup of sumps/determination of sumps' discharge point/delineation of soil contamination under fuel oil ASTs/closure of fuel oil tanks must be done by end of Oct. 2010. informed Ms. Ungar that the Department will not approve anymore time extension due to legal battle between the property owner and the crysler.Dorit UngarKasowitz, Benson, Torres & Friedman LLP1633 BroadwayNew York, New York 10019Ph. (212) 506-1992Fax (212) 500-3492email: DUngar@kasowitz.com10/26/10-Hiralkumar Patel.3:10 PM:- left message for Ms. Ungar.3:12 PM:- spoke with Barbara Pearl. Ms. Pearl mentioned that Langan is doing work. Ms. Pearl also mentioned that fuel oil tanks have been registered (2-611425) and Chrysler will register their waste oil tanks. Ms. Pearl mentioned that there are total of four 2,500 gal fuel oil tanks: two aboveground in contact with surface and two underground. Ms. Pearl will ask John at Langan to send cleanup updates and will ask Chrysler to send updates regarding waste oil tank registration.3:25 PM:- left message for Mr. Muscolino at Chrysler.10/27/10-Hiralkumar Patel.11:34 AM:- received message from John from Langan.12:34 PM:- left message for John.1:55 PM:- received call from John. he mentioned that they found total of six tanks in building basement: - two 2,500 gal ASTs (not 8,000 or 10,000 gal tank as previously estimated) encased in concrete in boiler room. these tanks were observed by DEC during site visits. John mentioned that these tanks were completely aboveground sitting on saddles inside concrete wrap. they cleaned and filled tanks with foam- two 2,500 gal USTs underneath boiler room floor. these two tanks were found running perpendicular to the trench in boiler room where oil was found. John mentioned that after further investigation, they found that the four sumps in boiler room were actually manways to these two USTs. also, the trench in boiler room is for piping for these USTs and this trench had no discharge point. Langan cleaned both USTs and trench and filled with concrete- one 550 gal AST (probably for gasoline or diesel) encased in concrete. tank was cleaned and filled with foam.- one 1,500 gal AST (probably for #2 oil) encased in concrete. tank was cleaned and filled with foam.John mentioned that the 550 gal and 1,500 gal tanks were found in other part of basement. they are in process of registering these tanks also. John also mentioned that the waste oil tanks (old and new) are owned by Chrysler but the old tanks were registered by property owner in past. so when Chrysler sent PBS application to close old tanks and to register new tanks, DEC Albany has rejected the application stating that tank owner's information doesn't match with the old record. as per John, Chrysler hasn't responded yet. asked John to send old PBS number and related documents for review. John will send spill cleanup report by end of 11/30/10.2:17 PM:- left message for Mr. Muscolino. asked him to return call by end of 10/29/10 with PBS number for waste oil tank or else case will be referred to legal.2:20 PM:- left message for Ms. Michaels.during further review of PBS record, found PBS number associated with waste oil tanks. now the property has two PBS numbers assinged:1. 2-611425: for old heating oil tanks in basement2. 2-609192: for lube and waste oil tanks owned/operated by Chrysler.as per PBS record (2-609192), Chrysler submitted PBS application to register waste oil tanks on 08/06/2010. and this application was rejected (on 08/09/10) as previous record

MANHATTAN CHRYSLER JEEP DODGE (Continued) **S108982853**

shows property owner as the tank owner and tank info doesn't match with old record. as per old record, site has two 275 gal tanks for lube oil, three 275 gal tanks for waste oil and one 275 gal tank for other. while as per the submitted application, site has one 980 gal tank for waste oil, one 275 gal tank for transmission fluid and two 275 gal tanks for motor oil. DEC Albany required submission of proof of change of ownership and correct info about tanks on property.2:39 PM:- received call from Mr. Muscolino. he mentioned that as per DEC Albany, property owner is responsible for tank registration. so now Chrysler's attorney is dealing with property owner's attorney.2:51 PM:- received call from Ms. Michaels. she mentioned that she spoke with Cynthia Freedman in DEC Albany office who confirmed that property owner is responsible for registration of tanks on property.3:00 PM:- spoke with Cynthia Freedman (518-402-9737) in DEC Albany. she mentioned that as per new law, property owner is responsible for tanks registration. asked her to send copy of the law.3:10 PM:- received email from DEC Cynthia with copy of Article 17, Title 10 of the Environmental Conservation Law. Cynthia mentioned that formerly, facility meant the tanks and owner meant the owner of the tanks, but as per new definition in law, facility means property and owner means owner of the property. as such property owner is responsible for registration of tanks on the property.3:28 PM:- spoke with Barbara Seril and informed her about change in PBS law. she agreed to register tanks but worried about maintenance of tanks. she will talk to her attorney about including tank maintenance issue in a lease agreement with Chrysler. informed her that i will send email with copy of law to all involved parties and asked her to reply back by end of 11/15/10 regarding waste oil tank registration. suggested her to close one of the PBS record and register all tanks on property under the other PBS number.3:43 PM:- sent email to Barbara Seril, Pearl Seril, John, Ms. Michaels, Ms. Unger, Mr. Muscolino including copy of PBS law.10/28/10-Hiralkumar Patel. received email from John (at 5:15 PM on 10/27/10) including site map showing former tanks in basement.10/29/10-Hiralkumar Patel.3:54 PM:- sent email to Barbara Seril, Pearl Seril, Ms. Michaels and Mr. Muscolino. informed that one of the tank owners has to register waste oil tank. asked them to provide info about who is going to register waste oil tanks, by the end of 11/15/10. also, asked to register waste oil tanks by the end of 11/30/10 or else a notice of violation will be issued. email copied to John and Ms. Unger.11/24/10-Hiralkumar Patel. received report from John (at 5:24 PM on 11/23/10). abstract:- four ASTs and two USTs were closed-in-place- two approx. 6,000 gal #6 oil USTs located in former boiler room (under the trench where product observed)- two approx. 2,000 gal concrete encased #2 oil ASTs located in the former boiler room- one approx. 550 gal concrete entombed #2 oil AST located in teh fire pump control room- one approx. 1,500 gal concrete entombed #2 oil AST located in a vault under the sidewalk along West 51st Street- trench was associated with the USTs and not a separate utility trench- fuel lines to the two 6,000 gal USTs ran within the 20 ft trench and at the end of the trench had a 90 degree bend and turned up to apparently supply fuel to either the former boilers and/or the former ovens- based on visual inspection, the trench was self-contained and did not have any discharge points- during removal of associated piping from trench, approx. 2.5 vertical ft of petroleum-impacted fill material was encountered and removed from the base of the trench- apparently, the fill material had been emplaced in teh base of the trench on which the fuel lines rested-

MANHATTAN CHRYSLER JEEP DODGE (Continued) **S108982853**

two USTs were installed within bedrock and were subsequently completely entombed in concrete (no soil was encountered around the 6,000 gal USTs)- dimensions of 6,000 gal USTs were roughly 21 ft long by 7 ft in diameter- no evidence of degradation was observed in either of the USTs- concrete floor below the two 2,000 gal ASTs was found in good condition- approx. 275 gal of #2 oil was removed from 550 gal AST and approx. 1,216 gal of #2 oil was removed from the 1,500 gal AST- 550 gal tank was entombed with approx. 8 inches of concrete and 1,500 gal tank was entombed with approx. 10 inches of concrete- no impacts were observed withtin either of two concrete vaults- ASTs were abandoned via filling with foam and USTs and trench were abandoned via filling with concrete11/29/10-Hiralkumar Patel. checked PBS record and found that waste oil tanks have been registered by Barbara Seril.based on available information/documents, case closed.11:25 AM:- sent spill closure letter to Barbara Seril/Pearl Seril. letter emailed to Barbara/Pearl Seril, Ms. Michaels, Mr. Muscolino and John.

Remarks: During site visit by DEC Vought. Impacted soil present in boiler room pit, tanks are also USTs with no tightness testing data and free product previously found under basement floor (see also spill #0304103)

DEC Memo: Prior to Sept, 2004 data translation this spill Lead_DEC Field was "SANGESLAND"On June 13, 2001, DEC Sigona received a tank closure report from AKRF, dated June 13, 2001.Spill was reassigned to Steve Sangesland on Feb 7, 2002 as per request. 3/25/2002 - Sangesland reviewed the AKRF Closure Report dated June 2001. The report outlines the removal of a 550 tank and the excavation of contaminated soil down to a depth of 18 feet (ground water level). Four sidewall samples were taken. All were clean for VOC's, Three were clean for SVOC's. One side wall sample had SVOC levels over STARS, AKRF suggested that these levels were within "typical background fill" levels.The report was missing a scaled site plan showing the location of the former tank and the subject excavation. The report also did not identify if any groundwater sampling had been conducted.3/28/2002 - Sangesland spoke with Arnold Fleming of AKRF (212- 696-0670) and requested a resubmittal with both a site plan and ground water VOC/SVOC test results. 4/10/2002 - Julie Foley of AKRF called to say more contaminated soil was found around two additional tanks on this site. A new spill number was called in (0110824) and assigned to Tim DeMeo.The site is a huge excavation site now and the new building going up on this site will be "500 West 56th St". **********Actions Taken**********1) Sangesland changes the listed address for this spill to 500 West 56th Street.2) Sangesland closed out the new spill number (0110824) and referenced that spill number back to this spill number.3) Sangesland directed AKRF to write a single closure report for the property referencing the new address (500 W 56th)and including both tank/spill locations.4) AKRF requested the DEC to return the copy of the June 2001 AKRF report sent in previously.********** Notes rolled over from Spill #0110824 ********2/14/02 Plaza Construction and its subcontractors struck 2 abandoned UST's while excavating for a new building foundation at construction site. Tanks removed from site prior to DEC inspectin. Approximately 20 cu. yds. of contaminated soil was stockpiled on site for disposal.DEC Spills requested from AKRF Inc. (environmental consultant) copies of analytical data from stockpiled soils, disposal manifests and scaled site drawing depicting former tank locations.Ray Ranami - Plaza Construction
917-577-4656**********
*7/2/2002 - Sangesland reviewed a "Closure Report" dated June 28, 2002 and submitted by AKRF (Sarah Lopas 646-459-3525). The report basically brings together the data for 3 seperate tank pulls from the property over a 1 year period. Two of the three locations had "End Point Soil Samples" which exceeded TAGM SVOC levels. AKRF states that this is common for background levels, but there is no "back up data" to prove the point.Sangesland spoke with Sarah Lopas at AKRF about the issue and she'll check it out and get back to the DEC soon. 7/15/2002 - Sangesland spoke with Andy Rudko of AKRF concerning the high SVOC levels at two of the tank pull areas. Andy said the SVOC levels were from historical fill, he also said that at this point the site has been over excavated to clear for the new building. Instead of putting together an exposure report based on historical fill all around the area, Sangesland requested a letter and photographs to document the fact that the area had been excavated further and that AKRF believes the contaminated soil is gone.2/14/2003 - Sangesland

(Continued) **S104950706**

reviewed an AKRF submittal dated January 16, 2003 which contains photographs of the site. These photos clearly show the over excavation of the site down to a "sub-basement" depth. Design drawings were also submitted which showed a deep basement area was to be dug out. Clearly the contaminated soil areas are gone from this site.Spill Closed

Plan is dated October 2003 was received @R2 on October 17, 2003. Work plan outlines proposed well location. Well location verbally approved on this date.11/21/03 TJDAs directed RND attempted to install one well in an effort to obtain a water sample. Refusal encountered. Well location moved and reattempted, again refusal due to competent bedrock. Screening of the drill cuttings did not exhibit any evidence of contamination. No further action required. Spill closed.
